   3.4 Applications of sigma ...................................... 22  

4 **Sets** .......................................................... 23  
   4.1 Introduction to sets. ........................................ 24  
   4.2 Operations on sets. .......................................... 24  
   4.3 Venn diagrams. .............................................. 25  

5 **Probability** .................................................. 26  
   5.1 Introduction to probability. ................................. 27  
   5.2 Principle of inclusion/exclusion. ........................... 27  
   5.3 Conditional probability. .................................... 28  
   5.4 Gold Lotto. ................................................ 29  

6 **Straight lines and their graphs** ............................ 30  
   6.1 Introduction to graphs ...................................... 31  
   6.2 Sketching equations ........................................ 32  
   6.3 Straight line (linear) graphs ............................... 32  
   6.4 Standard form for the equations of straight lines ....... 32  
   6.5 Lines parallel to the axes. ................................ 33  
   6.6 Finding gradients .......................................... 33  
   6.7 Finding the equation of a straight line .................. 34
6.8 Parallel and perpendicular lines ........................................... 34
6.9 Measuring distance ............................................................... 35

7 Intersecting lines; simultaneous equations ................................. 37
7.1 Intersections of lines .............................................................. 38
7.2 Solving simultaneous equations ............................................. 39

8 Functions ................................................................................. 43
8.1 Functions and function notation ............................................. 44
8.2 Domain and range ................................................................. 45
8.3 Composition of functions ..................................................... 45

9 Quadratic equations and polynomials ....................................... 47
9.1 Introduction to polynomials .................................................... 48
9.2 Quadratics ............................................................................ 48
9.3 Shapes of some polynomial functions ..................................... 49
9.4 Solving quadratics using the Quadratic formula ....................... 49
9.5 Solving quadratics by factoring ............................................. 50
9.6 Applications of quadratics ..................................................... 50

10 Logarithms and exponentials ................................................... 51
10.1 Introduction to exponentials .................................................. 52
10.2 Exponential growth ............................................................... 52
10.3 Compound interest ............................................................... 53
10.4 Exponential decay ............................................................... 53
10.5 The exponential function, $e^x$ ............................................. 53
10.6 Logarithms ........................................................................... 55

11 Miscellaneous non-linear functions ......................................... 56
11.1 Non-linear functions ............................................................. 56
11.2 Circles ................................................................................. 57

12 Trigonometry ............................................................................ 58
12.1 Introduction to trigonometry .................................................. 59
12.2 Evaluating $\sin \theta$, $\cos \theta$ and $\tan \theta$ ............................... 60
12.3 Radians ............................................................................... 60
12.4 Angles bigger than $\pi/2$ (90°) ............................................... 61
12.5 Graphs of $\sin x$, $\cos x$, and $\tan x$ ..................................... 61

13 Derivatives and rates of change ............................................... 62
13.1 Differentiation and derivatives ............................................. 63
13.2 Interpreting derivatives ......................................................... 64
13.3 Simple differentiation ........................................................... 65
13.4 Derivatives of some common functions ................................. 66
13.5 Product rule ....................................................................... 66
13.6 Quotient rule ..................................................................... 68
13.7 Chain rule ......................................................................... 69
13.8 Second derivatives ............................................................... 71
14 Applications of derivatives

14.1 Tangent lines. ......................................................... 73
14.2 Derivatives and motion. .......................................... 73
14.3 Local maxima and minima. ................................... 73
14.4 Some practical problems. ...................................... 74

15 Integration

15.1 Introduction to integration. ................................... 76
15.2 Rules for integration. ............................................ 76
15.3 Initial conditions. ................................................. 77
15.4 Definite integrals and areas. .................................. 77
15.5 Integrals and motion. ............................................. 77

16 Previous exams and exam techniques

16.1 Possible exam techniques ...................................... 80
16.2 Midsemester exam, 2006 ......................................... 81
16.3 Solutions to midsemester exam, 2006 ...................... 84
16.4 Midsemester exam, 2005 ......................................... 87
16.5 Solutions to midsemester exam, 2005 ...................... 90

16.22 Final exam, 2001 ................................................... 140
16.23 Solutions to final exam, 2001 ................................ 142
Introduction

Welcome to The University of Queensland course, Basic Mathematics. If you are doing this course, you will probably be enrolled in MATH1040 (if you are an undergraduate student) or MATH7040 (if you are a postgraduate student). But don’t worry: both courses cover exactly the same material, with the same assessment.

The aim of this study guide is to provide an additional resource for students undertaking the Basic Mathematics course.

This study guide is designed as a companion to the course lecture notes, which are a complete set of lecture slides that are shown to students attending regular classes. The notes contain all of the mathematical content, including many examples and sample questions for each section.

It is essential that you obtain a copy of the course lecture notes, for the current year (as there are changes and amendments from year to year). You can purchase the notes from the university, or you can print them from the internet, or if you are a MATH7040 student, a copy will be sent to you. We will make frequent reference to those notes and you should have them on hand whenever you work from this study guide.

Recent changes

Keeping with the annual tradition of making improvements each year, the notes have once again been changed at the end of 2006. The first few sections have been cleaned up a lot, some new material added (on estimating and checking), and the order changed a bit (for example, square roots and surds moved from Section 1 to Section 2). The entire section on limits (at the start of Calculus) has been deleted.

Sections in the notes and study guide underwent a major reordering at the end of 2005, with several sections split. The new ordering means that some topics previously covered on the midsemester exam will not be covered there from 2006 onwards, and some sections previously not covered on the midsemester exam now will be.

The notes and study guide underwent major revisions of style and formatting at the end of 2004. The new material was very different to older versions. Previous exam papers and solutions were included in the study guide for the first time. Matrices were removed from the content at the end of 2004, and circles were introduced. Also, the sections on probability and logs and exponentials were rewritten and greatly expanded. These sections will be examined much more heavily starting 2005.
Structure of the study guide

This study guide provides two useful sources of information. The first 80 or so pages will help you work through the lecture notes, highlighting what is important, and giving some extra information. If you are working independently, or if you wish to read some material before the lectures, then use this section of the study guide to direct your work. Each section also directs you to some relevant practise questions. The final 60 or so pages of this guide give a number of midsemester and final exam papers from recent years, with worked solutions. Your exams will be very similar to these.

Here, we describe the structure of this study guide, to help you make effective use of it.

Each section of this study guide corresponds to a section of the MATH7040 lecture notes. Rather than immediately hitting you with a whole collection of obscure mathematics, we want you first to understand why we are studying particular topics, and where they will be useful. Each section of the study guide commences by explaining the relevance of the material, in the following manner:

What? What is it? A brief description of the topic covered in this section.

Who? Who uses it? Some of the people who might use this material in their job or in everyday life.

How? How is it used? An example of a practical application of the topic.

Why? Why are we doing it? Some reasons the material is included in this course.

Next, each section has a list of key learning goals. These are the set of skills that you should have acquired on completion of the section. They will be presented in the following format:

At the end of this section you should:

- Here you will find a list of key learning goals, for example:
  - Understand the format of the study guide.

- You may find some extra examples or hints.

Next, you need to start working through the mathematical content in the lecture notes. The lecture notes are further divided into subsections, and the study guide matches this format. Each of the subsections will be discussed as follows:
Recommended reading

• You’ll be referred to certain pages in the lecture notes.

• Occasionally, you’ll be given a reference to somewhere containing extra information.

Key learning goals for the subsection. These may be:

• Understand some definitions.

• Apply some techniques.

• Remember some critical points.

Difficult concepts
Tips for understanding these concepts will also be given. For example:

• This introductory section contains a lot of material.
  – Read through this material several times to ensure you understand it.

Recommended exercises

These are the recommended exercises to test your understanding of the material. All exercises are at the end of this study guide, with worked solutions. Note that every exercise comes off a previous exam paper, so gives an excellent idea of what you should expect this year.

Previous exam papers
The last part of this study guide comprises midsemester and final examination papers from the last few years, starting on Page 79. Each exam paper is followed by a full set of solutions.

Acknowledgments
Many thanks to Trevor Pickett, who did much of the work in this guide, including writing and drawing many of the excellent cartoons. Thanks also to Jane Boulton, who provided all exam papers, solutions and examples.
1 Numbers and arithmetic

What?
In this section we give a quick introduction to different types of numbers, and some operations that can be performed on them. Most of you will be familiar with most of this material. However, you might have forgotten some of it, and some of the concepts will probably be new. We’ll cover things like number systems, absolute values, mathematical operations, precedence, prime numbers, fractions, exponentials and square roots.

Who?
Numbers are one of the most fundamental concepts in human existence, and underpin almost everything you see and do. Almost everyone will make use of these techniques, in their everyday life and in their jobs.

How?
You can use this material to do such things as work out the fuel economy of your car, create a weekly budget, complete your tax return, estimate the interest you pay on a car loan, interpret a mobile phone bill or work out your GPA.

Why?
This section introduces some of the basic skills you’ll need to complete this course. For some people it will simply be a revision section, for others it will be much harder. However easy or difficult you find it, completion of this section will greatly help when you tackle the harder concepts later on in the notes. In particular, many people find numbers easy, but have a lot of trouble when it comes to using letters in algebraic manipulations. If you think about this material and become very comfortable with it then everything else you do will be much easier.
At the end of this section you should be able to:

- Appreciate the importance of thinking about your answer and checking.
- Identify the different types of numbers.
- Understand the concept of number lines and order.
- Be able to find the absolute value of a number.
- Perform simple mathematical operations in the correct order.
- Identify prime numbers.
- Find factors of integers.
- Work confidently with fractions.
- Correctly evaluate a number raised to an exponent.
- Understand basic square roots.

Work through this section as follows:

1.1 Thinking about Maths.

Read pages 8 – 10 of the lecture notes, and work through any examples.

Thinking and checking

- The concepts and approaches presented here are very important. Don’t just look at the content and then forget it.

- Whenever you solve a problem using mathematical concepts (in this course, or another course, or in your job when you enter the workforce) you should always look at the answer and see if it looks sensible.

- You should also check your working.

- Be a bit careful; if an answer looks wrong, it might still be correct. As you practice more, you will develop better judgement of what’s correct and what’s incorrect.

- On an exam, if your answer is wrong but you recognise that it’s wrong, and explain how you know that it’s wrong, then you’ll receive more marks than if you just have a wrong answer.

- Being able to estimate an approximate answer is a very useful skill!
1.2 Types of numbers.

Read pages 11 – 13 of the lecture notes, and work through any examples.

Number types

• Be comfortable with the definition of each type of number.
• Remember the notation:
  – \( \mathbb{N} \) means Natural numbers.
  – \( \mathbb{Z} \) means Integers.
  – \( \mathbb{Q} \) means Rational numbers.
  – \( \mathbb{R} \) means Real numbers.

• Note that:
  – every Natural number is also an Integer
  – every Integer is also a Rational number
  – every Rational number is also a Real number

• In each case, the converse is not true.

1.3 Number lines and order.

Read pages 13 – 14 of the lecture notes, and work through any examples.

1.4 Absolute value.

Read pages 14 – 15 of the lecture notes, and work through any examples.

Absolute values

• If the number is positive, then absolute value leaves the number unchanged.
• If the number is negative, then absolute value removes the negative sign.
1.5 Simple mathematical operations.

Read pages 16 – 17 of the lecture notes, and work through any examples.

Mathematical operators

- Brackets can be written as ( ) or [ ].
- We can write \( a \times b \) as \( a \cdot b \) or \( ab \).
- We can write \( a \div b \) as \( a/b \) or \( \frac{a}{b} \).
- Note what happens when you multiply or divide two negative numbers: the two negative signs cancel.

Dividing by zero.

Be careful: you cannot divide by zero. If ever you are asked to, your answer should be “undefined” or “not possible”.

1.6 Order of operations.

Read pages 17 – 19 of the lecture notes, and work through any examples.

BEDMAS

- Know how to apply BEDMAS.
- Remember that multiplications and divisions are performed from left to right, in the order in which they appear in the expression. Similarly, additions and subtractions are also done in the order in which they appear, from left to right.

Understanding order of operations

It is critically important that you can understand and apply operations in the correct order. Much of the work in this course, and many other courses, requires this skill. Practise until you can do it easily.
1.7 **Prime numbers and factors.**

Read pages 20 – 22 of the lecture notes, and work through any examples.

**Factors**
- The tricks for finding small factors ‘in your head’ are often useful. However, you don’t need to remember them, and may well prefer to use a calculator.
- Understand the meaning of the terms: *prime number, common factor, highest common factor, relatively prime.*

1.8 **Fractions.**

Read pages 23 – 26 of the lecture notes, and work through any examples.

**Fractions**
- Understand the meaning of: *numerator, denominator, inverse, equivalent fractions, simplest form, cancellation, common denominator.*
- Be able to add, subtract, multiply and divide fractions.

**Working with fractions**
Many people find fractions difficult to work with. Even if you think they are easy, fractions get much harder when the denominator and/or numerator includes letters and mathematical expressions. We use fractions quite a lot in this course, so take the time to practise on some easy examples.

1.9 **Introduction to exponentiation.**

Read pages 28 – 30 of the lecture notes, and work through any examples.

**Basic exponentiation**
- Be able to evaluate basic exponential terms.
- Understand what happens to negative numbers when they are raised to odd powers (the answer is negative) versus what happens when they are raised to even powers (the answer is positive).
1.10 Square roots; higher order roots

Read pages 31 – 33 of the lecture notes, and work through any examples.

Square roots

- This is just a brief introduction to the idea of square roots, and we’ll cover them in much more detail later on.
- Understand why a negative number does not have a square root. (Actually, if you study more maths, you see a new type of number system, called complex numbers, that do allow us to find square roots of negative numbers. But as far as we are concerned, negative numbers do not have square roots.)

Higher order roots

- Understand the meaning of higher order roots, particularly cube roots.

Finally.

To reinforce the material from this section, you should attempt the following questions from previous exam papers. Solutions to each question are included after the exam paper which contained the question.

1. Section A, multichoice, Question 8, Page 82.
2. Section B, Question 1, Page 82.
3. Section A, multichoice, Question 6, Page 88.
4. Section B, Question 1, Page 88.
5. Section A, multichoice, Question 5, Page 93.
6. Section A, multichoice, Question 8, Page 94.
7. Section B, Question 1, Page 94.
8. Section A, multichoice, Question 8, Page 100.
9. Section B, Question 1, Page 100.
10. Section A, multichoice, Question 4, Page 105.
11. Section A, multichoice, Question 8, Page 105.
12. Section B, Question 1, Page 106.
2 Algebra

What?
In this section we study expressions that involve letters. We will use the techniques similar to those we encountered in the previous section (numbers) to manipulate and simplify these expressions. Many people find this manipulation (commonly called algebra) to be confusing. Topics we’ll cover include algebraic expressions, expanding and factorising, formulae, equations, solving problems involving absolute values, intervals, inequalities, square roots, and power rules.

Who?
Introducing letters into expressions is a logical and important step beyond only using numbers. Every computer program or spreadsheet makes use of algebraic expressions. Almost every problem that requires any significant mathematical sophistication will need to be specified using a combination of letters, numbers and operations.

How?
You can use this material to do such things as developing a spreadsheet for managing a budget, calculating total tax payable on various income levels, writing software to optimise production in a company, calculating areas and lengths of various physical quantities and predicting the outcome of movements in the world oil price.

Why?
For the rest of semester, and in your subsequent university study, you will continually encounter questions and problems which need to be formulated and solved using these techniques. It will be assumed that you are completely comfortable with this approach, so it’s important that you take the time to get a firm grasp of the material.
At the end of this section you should be able to:

• Identify algebraic expressions.
• Expand, factorise and simplify an algebraic expression.
• Transpose and solve equations and formulae.
• Solve problems involving absolute value signs.
• Solve problems involving inequalities and write your answers:
  – On a number line.
  – In interval notation.
  – In inequality form.
• Manipulate square roots.
• Apply the power rules.

Work through this section as follows:

2.1 Introduction to algebra.

Read pages 35 – 39 of the lecture notes, and work through any examples.

Algebraic expressions

• Understand the meaning of: variable, algebraic expression, coefficient, like term.
• Be able to group like terms.

Many people are ok with numbers, but freeze with letters. There is no reason to be afraid. Letters are just like numbers, but we don’t know their actual value.

Grouping like terms

When grouping like terms you must move the term and the sign associated with it. For example:

\[ 2x^4 + 4x^2 + 8 - 9x^4 - 3x^2 - 6 = 2x^4 - 9x^4 + 4x^2 - 3x^2 + 8 - 6 \]
Arithmetic on algebraic expressions

- Be able to simplify algebraic expressions by applying BEDMAS and adding or subtracting like terms.

2.2 Expanding and factorising.

Read pages 40 – 48 of the lecture notes, and work through any examples.

Expanding

- Understand the different ways to expand an expression involving brackets. (In the notes there are three sets of rules. Don't try to commit them to memory: in fact, they are effectively the same rule, applied to different cases. The two diagrams in the notes should make it clear.)

- Be able to simplify an algebraic expression after expanding.

Factorising

- Understand what it means to factorise an algebraic expression.

- Be able to simplify an algebraic expression by factorisation.

2.3 Equations and Formulae.

Read pages 48 – 53 of the lecture notes, and work through any examples.

Equations

- Be able to evaluate an equation by substituting in values.

- Be able to transpose equations.

- Understand the relationship between transposition and solving equations.
Transposing and solving equations

Transposing and rearranging equations can be quite difficult. The two rules for transposing are very important and you should remember them. They can be summarised as:

Whatever you do to one side you must also do to the other side.

2.4 Solving absolute values.

It may help to first review Section 1.4 (Absolute value).

Read pages 54 – 55 of the lecture notes, and work through any examples.

2.5 Intervals on the real line.

It may help to first review Section 1.3 (Number lines and order).

Read pages 56 – 58 of the lecture notes, and work through any examples.

Intervals

• Remember that

  – a solid circle or a square bracket represent \( \leq \) and \( \geq \).
  – a non-filled circle or a round bracket represent \( < \) and \( > \).
  – each pair of brackets in interval notation contains two numbers. The left-hand number is always smaller than the right-hand number.

2.6 Inequalities.

Read pages 59 – 60 of the lecture notes, and work through any examples.

Solving inequalities

Be careful when dividing or multiplying by negative numbers. Remember that the inequality must be reversed.
2.7 Square roots.

It may help to first review Section 31 (Square roots; higher order roots).

Read pages 61 – 67 of the lecture notes, and work through any examples.

Square roots

• Try to understand the properties and non-properties of square roots.

Surds

• Be able to manipulate surds by:
  – simplifying
  – multiplying
  – rationalising the denominator

Simplifying surds

Some people get confused when simplifying an expression like $4\sqrt{6} \times 2\sqrt{3}$. This expression is really $4 \times \sqrt{6} \times 2 \times \sqrt{3}$ and we already know that we can change the order as the only operations are multiplication. Hence we can multiply the coefficients together and the surds together, giving

\[
4 \times 2 \times \sqrt{6} \times \sqrt{3} = 8 \times \sqrt{18} \\
= 8 \times 3\sqrt{3} \\
= 24\sqrt{2}
\]

2.8 Powers and Exponents.

It may help to first review Section 1.9 (Exponentiation).

Read pages 67 – 73 of the lecture notes, and work through any examples.

Exponents

• You must know and be able to apply the power rules.
  
• Understand that the \textbf{bases must be the same} for the rules to work.
Finally.

To reinforce the material from this section, you should attempt the following questions from previous exam papers. Solutions to each question are included after the exam paper which contained the question.

1. Section A, multichoice, Qn 3, Page 87
2. Section B, Qn 2, Page 88
3. Section B, Qn 3, Page 88
4. Section B, Qn 4, Page 89
5. Section A, multichoice, Qn 4, Page 93
6. Section A, multichoice, Qn 9, Page 94
7. Section B, Qn 2, Page 94
8. Section B, Qn 3, Page 95
9. Section B, Qn 4, Page 95
10. Section B, Qn 6, Page 95
11. Section B, Qn 7, Page 95
12. Section A, multichoice, Qn 4, Page 99
13. Section A, multichoice, Qn 9, Page 100
14. Section A, multichoice, Qn 13, Page 100
15. Section B, Qn 2, Page 100
16. Section B, Qn 4, Page 101
17. Section B, Qn 6, Page 101
18. Section B, Qn 7, Page 101
19. Section A, multichoice, Qn 9, Page 106
20. Section B, Qn 2, Page 106
21. Section B, Qn 4, Page 107
22. Section B, Qn 5, Page 107
23. Section B, Qn 6, Page 107
24. Qn 2, Page 117
25. Qn 4, Page 123
26. Qn 4, Page 135
27. Qn 4, Page 140
28. Section B, Qn 3, Page 101
29. Section B, Qn 3, 106
30. Sect A, multichoice, Qn 1, 2, Page 81
31. Sect A, multichoice, Qn 9, Page 82
32. Section B, Qn 2, Page 82
33. Sect B, Qn 6,7,8,10,11, Page 83
34. Qn 1(a), 5(a), Page 111
35. Qn 7, Page 112

You should be able to do most of the first group of questions in Part A from the midterm exams, missing out any that involve curly brackets (like { and }) or sigma-notation (written like Σ). For example, on Page 81 you can do all of the first 26 questions except for numbers 2, 14, 22, 23, 24 and 26.
3 \[ \sum \text{ notation} \]

What?
This section gives a basic introduction to sigma notation, which is a short-hand way of writing extended sums. We’ll investigate sigma notation, seeing how to convert sums to sigma notation and expand and evaluate sums expressed in sigma notation. (That \[ \sum \] symbol in the title of this section is the Greek letter sigma. By convention this symbol means “to sum”, and so this notation is sometimes referred to as summation notation).

Who?
People often want to write lengthy sums in a more compact form. Hence sigma notation is used by statisticians, biologists, economists and computer scientists as a quick and convenient way of writing long (or even infinite) sums.

How?
You can use this material to do such things as work out the mean value of some data (such as heights, income or marks on an exam), to calculate probabilities or to calculate the size of a growing population.

Why?
Sigma notation is used because writing out very long sums can be impractical. Some general way of expressing the sum using a formula is very important.

At the end of this section you should be able to:

- Express a sum in sigma notation.
- Write a sigma notation expression as an expanded sum and evaluate if required.
Work through this section as follows:

### 3.1 Introduction to sigma notation

Read pages 75 – 76 of the lecture notes, and work through any examples.

**Sigma notation**
- Understand the meaning of the terms: upper bound, lower bound, expression.

### 3.2 Expanding sums

Read pages 76 – 78 of the lecture notes, and work through any examples.

**Sigma notation skills**
- You must be able to take an expression written in sigma notation and expand it.
- Remember that the variable (for example, \( i \)) always increases by 1 each time.
- Remember \( i \) is a dummy variable. We can use any letter we like, so:

\[
\sum_{i=1}^{4} i = \sum_{j=1}^{4} j = \sum_{k=1}^{4} k = 10
\]

### 3.3 Reducing sums

Read pages 79 – 80 of the lecture notes, and work through any examples.

**Sigma notation skills**
- You must be able to take an expanded sum and write it in sigma notation.

**Checking your sigma notation expressions**
When writing an expanded sum in sigma notation you should always check your answer by expanding it and seeing if you get the sum you started with.
Sigma notation

Many students have trouble with converting a sum to sigma notation. Here are some things to try if you are having trouble:

- Examine the terms in the sum and look for a pattern of numbers increasing by one each time.
- Are the terms all even? Then you need to use something like $2i$.
- Are the terms all odd? Then you need to use something like $2i + 1$.
- Are the terms powers of $i$? For example:

\[
1 + 4 + 9 + 16 + \ldots = 1^2 + 2^2 + 3^2 + 4^2 + \ldots \\
1 + 8 + 27 + 64 + \ldots = 1^3 + 2^3 + 3^3 + 4^3 + \ldots
\]

3.4 Applications of sigma

Read pages 81 – 82 of the lecture notes, and work through any examples.

Finally.

To reinforce the material from this section, you should attempt the following questions from previous exam papers. Solutions to each question are included after the exam paper which contained the question.

1. Section B, Qn 5, Page 89  
2. Section B, Qn 9, Page 95  
3. Section B, Qn 14, Page 95  
4. Section B, Qn 8, Page 101  
5. Section B, Qn 8, Page 107  
6. Qn 1, Page 117  
7. Qn 1, Page 123  
8. Qn 1, Page 129  
9. Qn 1, Page 135  
10. Qn 21, Page 136  
11. Qn 1, Page 140  
12. Section B, Qn 3, 4, 13, Page 83  
13. Qn 11, Page 112
In this section we move away from numbers and algebra, and examine sets. Set theory provides us with some notation and tools for operating on groups of objects. We will introduce set terminology and notation, then see how to perform certain operations on sets, and finally we will see how to represent sets pictorially using Venn diagrams.

Many people want to look at operations on groups of objects, such as what they have in common, how groups can be combined and how they overlap. Hence concepts from set theory are used very widely, by economists, statisticians, computer scientists, physicists, biologists, and other scientists.

Sets can be used in data analysis. For example, given the results from a recent newspaper readership poll, determine how many people read Saturday’s paper? How many people read Sunday’s? How many people read neither? How many people read both?

This section provides the basic skills you’ll need to analyse the relationships between groups of objects. We will frequently use set notation to define mathematical concepts later in this course. For example, we’ll study probability in terms of sets. Also, many other university courses will also use set notation in their definitions.
At the end of this section you should be able to:

- Understand basic set terminology.
- Differentiate between: union, intersection, and set theoretic difference.
- Know the meaning of: subset and empty set.
- Draw a Venn diagram and identify relevant areas.

Work through this section as follows:

4.1 Introduction to sets.

Read pages 84 – 86 of the lecture notes, and work through any examples.

Introduction to sets

- Understand the terminology. Remember
  - sets are always enclosed by curly braces { }.
  - in set theory, | means such that, not absolute value.
  - ∈ means is an element of.
  - ∈ means is not an element of.
  - ∅ or { } means empty set.
  - ⊆ means is a subset of or equal to.

- Know how to list the elements in a set based on some property (for example, \( S = \{ x | x^2 = 4 \} \) means \( S = \{-2, 2\} \)).

4.2 Operations on sets.

Read pages 87 – 89 of the lecture notes, and work through any examples.

Operations on sets

- You must know:
  - \( A \cap B \) means elements in both set \( A \) and set \( B \).
  - \( A \cup B \) means elements either in \( A \) or in \( B \) (or in both).
  - \( A \setminus B \) means elements in \( A \) but not in \( B \).
Operations on sets

The operators union (\(\cup\)), intersection (\(\cap\)) and set theoretic difference (\(\setminus\)), are very important. Many students do not understand them properly and do poorly on their exams. Be very clear on \(\cap\) versus \(\cup\). For example, \(A \cap B\) means the elements that are part of set \(A\) and also part of set \(B\). Finding \(A \cap B\) is easy. Go through the elements of \(A\) one at a time and ask “Is this element also an element of \(B\)?” If the answer is yes, then the element is in the intersection. If the answer is no, then it’s not in the intersection.

4.3 Venn diagrams.

Read pages 90 – 91 of the lecture notes, and work through any examples.

Venn diagrams

- Know how to draw Venn diagrams for two and three sets and how to mark elements on the diagram.
- Be able to identify relevant intersection and union areas on the Venn diagram.
- Be able to extract sets from a Venn diagram.
- Remember: \(A \cap \emptyset = \emptyset\) and \(A \cup \emptyset = A\)

Finally.

To reinforce the material from this section, you should attempt the following questions from previous exam papers. Solutions to each question are included after the exam paper which contained the question.

1. Section A, multichoice, Qn 4, Page 88
2. Section A, multichoice, Qn 5, Page 88
3. Section B, Qn 6, Page 89
4. Section A, multichoice, Qn 6, Page 94
5. Section B, Qn 11, Page 95
6. Section A, multichoice, Qn 5, Page 99
7. Section A, multichoice, Qn 6, Page 99
8. Section B, Qn 11, Page 101
9. Section A, multichoice, Qn 5, Page 105
10. Section A, multichoice, Qn 6, Page 105
11. Section B, Qn 11, Page 107
12. Qn 3(a)-(d), Page 117
13. Qn 3, Page 123
14. Qn 3, Page 129
15. Qn 3, Page 135
16. Qn 3, Page 140
17. Section A, multichoice, last question, Page 82
5 Probability

What?
Probability is the study of chance. It is concerned with assigning a value to the possibility of a certain event happening. We commence by studying basic probability, then we introduce the principle of inclusion/exclusion, we study conditional probability, and finish with a brief (non-examinable) discussion of lotto.

Who?
Probability is used by many people including government departments and insurance companies. The entire gambling industry (including casinos, horse racing and bookmakers) is based on estimating probabilities.

How?
There are 45 balls in the Australian lottery system. To win, you need to select 6 numbers correctly. What is the probability that you will win if you play a single game? How about if you play one million games? Are you likely to do better playing roulette than lotto?

Why?
Having a basic understanding of probability will help in everyday life. However the main reason we are studying probability is to provide a basis for much more study which many of you will do in economics, business and mathematics courses.

This section contains some set notation. It may help to review Section 4 of the lecture notes (Sets) before continuing.
At the end of this section you should:

- Have a basic understanding of how probability works.
- Be able to calculate the probability of a given event.
- Be able to relate Venn diagrams to probability.
- Understand the principle of inclusion/exclusion for two events.
- Have a basic understanding of conditional probability.

Note that prior to 2005, probability was covered in less detail in this course. It is likely that it will be more heavily examined than previous exam papers suggest.

Work through this section as follows:

## 5.1 Introduction to probability.

Read pages 93 – 99 of the lecture notes, and work through any examples.

**Introduction to probability**

- Understand the meaning of the terms: probability, sample space, event, outcome, fair.

- Be able to calculate the probability $p$ of a given event.
  
  - Remember that $p = \frac{\text{number of favourable outcomes}}{\text{total number of possible outcomes}}$.
  
  - To calculate $p$, list the sample space, count the number of favourable outcomes, count the number of elements in the sample space and take the ratio.

- Know how to relate Venn diagrams to probability.

- Understand the relationship between the number of elements in each place on the diagram and the probability of corresponding events.

## 5.2 Principle of inclusion/exclusion.

Read pages 99 – 102 of the lecture notes, and work through any examples.
Definitions

- Be able to apply the principle of inclusion/exclusion:

\[ \text{Prob}(A \cup B) = \text{Prob}(A) + \text{Prob}(B) - \text{Prob}(A \cap B). \]

- Know that if \( A \cap B = \emptyset \), then \( A \) and \( B \) are said to be mutually exclusive events. This means that they cannot both happen together. We can calculate the probability of either event happening by simply adding their probabilities.

- Try to relate your knowledge of sets to these definitions.

5.3 Conditional probability.

Read pages 103 – 109 of the lecture notes, and work through any examples.

Conditional probability

- Know what is meant by the statement *the conditional probability that* \( A \) *occurs given that* \( B \) *occurs*: this means that it is already guaranteed that \( B \) occurs, so this will (probably) reduce the size of the sample space.

- Understand why the formula for conditional probability is valid: if \( \text{Prob}(B) > 0 \), then

\[ \text{prob}(A|B) = \frac{\text{Prob}(A \cap B)}{\text{Prob}(B)}. \]

- Be able to apply the product rule for probability:

\[ \text{Prob}(A \cap B) = \text{Prob}(A) \times \text{Prob}(B|A) = \text{Prob}(B) \times \text{Prob}(A|B). \]

Independent events

- Know that events are independent if the occurrence of either one has no impact on the probability of occurrence of the other. Thus \( \text{Prob}(A|B) = \text{Prob}(A) \) and \( \text{Prob}(B|A) = \text{Prob}(B) \).

- Know that if events are independent, the probability of them all occurring can be calculated by multiplying their probabilities.
Monty Hall problem

- The Monty Hall Problem is a very famous problem in probability. It is not examined in this course, but if you can understand it and follow the reasoning then you are doing well.

- If you like, you can investigate it further. One way of doing this is to do a search on the web for “monty hall”; you will find plenty of matches!

5.4 Gold Lotto.

This section is not examinable, but may help explain the probability behind Gold Lotto.

Read pages 110 – 113 of the lecture notes, and work through any examples.

Finally.

To reinforce the material from this section, you should attempt the following questions from previous exam papers. Solutions to each question are included after the exam paper which contained the question.

1. Question 3(e)-(f), Page 117
2. Question 7, Page 123
3. Question 7, Page 129
4. Question 7, Page 135
5. Question 7, Page 140
6. Section A, multichoice, Question 3, Page 81
7. Section B, Question 12, Page 83
6 Straight lines and their graphs

What?
This section gives a basic introduction to graphs. We’ll see how to plot data, and how to
draw the graphs of straight lines. Then we investigate properties of equations of straight
lines, including gradients and intercepts. We discuss the relationships between parallel
and perpendicular lines, and encounter the formula for the distance between two points.

Who?
Graphs are one of the most frequent ways of representing data. They are used by many
people, such as economists, statisticians, scientists, and sales people. Straight lines and
linear equations are used by many people including engineers, physicists and business
analysts. Most people use distance measurements every day of their lives.

How?
Here are two practical uses of this material.
Australia and India are playing in a one day cricket match. Represent the run rate for
both teams visually so that a television audience can immediately understand how their
favourite team is doing.
Roads are not flat: instead they slope down from the centre to the shoulder. This slope
is called the crossfall. The crossfall of a particular road is to be 3%. The finished height
of the centreline 18.357 metres above sea level. A point on the shoulder perpendicular to
this is 3.65 metres away. At what height above sea level should this point be?

Why?
Graphs provide us with the tools we need to solve certain problems and visualise data.
Rather than a confusing list of numbers, graphs provide a picture which can be more
easily analysed and interpreted. Much of your later year study (for example, microe-
conomics) will require you to both draw and interpret graphs. We need to be able to
analyse the relationship between input and output variables over a given interval. Lin-
ear (straight line) relationships are the simplest kind, so we develop tools to deal with
straight lines and adapt them for use with other kinds of functions later on.
At the end of this section you should be able to:

- Identify the $x$-axis, the $y$-axis and the origin.
- Plot coordinates on a set of axes.
- Identify the four quadrants of the plane.
- Identify the dependent and independent variables.
- Given a simple equation, calculate some $x$ and $y$ values, plot these values and sketch the resulting graph.
- State the equation of a straight line in general form.
- Take a given straight line equation and identify the gradient, the $y$-intercept and the $x$-intercept.
- Identify the equations of lines that are parallel to one of the axes.
- Given two points, calculate the gradient of a straight line between these points and then find the equation of the line.
- Calculate the slope of a line parallel to a given line.
- Calculate the slope of a line perpendicular to a given line.
- Find the distance between two points.

Work through this section as follows:

6.1 Introduction to graphs

Read pages 115 – 118 of the lecture notes, and work through any examples.

Introduction to graphs

- Understand the meaning of: $x$-axis, $y$-axis, origin.
- Points on our graph look like $(x$-coordinate, $y$-coordinate). Remember:
  - if the $y$-coordinate is 0, the point lies on the $x$-axis.
  - if the $x$-coordinate is 0, the point lies on the $y$-axis.
  - if both coordinates are 0, the point is the origin.
- Understand what sign $x$ and $y$ take (that is, positive or negative) if a point lies in a given quadrant.
- Know the meaning of dependent variable and independent variable and know which axis corresponds to which variable.
6.2 Sketching equations

Read pages 118 – 120 of the lecture notes, and work through any examples.

Sketching equations

- Given a simple linear equation:
  - be able to calculate some points on the line; and
  - be able to plot these points and draw a graph.

6.3 Straight line (linear) graphs

Read pages 121 – 124 of the lecture notes, and work through any examples.

Linear graphs

- Remember that you only need two points to plot a straight line
- Understand the meaning of the terms: \( y \)-intercept, \( x \)-intercept.

6.4 Standard form for the equations of straight lines

Read pages 124 – 128 of the lecture notes, and work through any examples.

Straight lines

- Know that the general equation of a straight line is \( y = mx + c \).
- Understand the meaning of the terms: gradient, slope.
- You must know that \( m \) is the gradient, and \( c \) is the \( y \)-intercept.
- Be able to recognise the slope and \( y \)-intercept from an equation of a straight line in standard form.
- Understand what form a graph takes with:
  - \( m \) negative, positive or equal to zero.
  - \( c \) negative, positive or equal to zero.
Gradient, slope or $m$?
Don’t get confused by the interchanging terms gradient, slope and $m$. The gradient is the slope, and this is the value that $m$ has when a straight line equation is written in the form $y = mx + c$.

6.5 Lines parallel to the axes.

Read pages 129 – 130 of the lecture notes, and work through any examples.

Lines parallel to the axes

- You must know that lines parallel to the $x$-axis:
  - are horizontal and therefore have slope $m = 0$.
  - have equations of the form $y = c$.
  - are easily identified from a pair of points, since the points will be of the form $(x_1, y)$ and $(x_2, y)$, with the same $y$ values.

- You must know that lines parallel to the $y$-axis:
  - are vertical and therefore have slope $m = \infty$.
  - have equations of the form $x = c$.
  - are easily identified from a pair of points, since the points will be of the form $(x, y_1)$ and $(x, y_2)$, with the same $x$ values.

Identifying lines parallel to the axes

Being able to easily identify lines parallel to axes from a pair of points will save you a great deal of time on an exam. All you need to remember is:

- Do the points share a common $y$ coordinate, say $c$? If yes, then the points lie on a line parallel to the $x$-axis with slope $m = 0$ and the equation for this line is $y = c$.

- Do the points share a common $x$ coordinate, say $c$? If yes, then the points lie on a line parallel to the $y$-axis with slope $m$ undefined and the equation for this line is $x = c$.

6.6 Finding gradients

Read pages 130 – 133 of the lecture notes, and work through any examples.
Calculating the gradient

It is not too hard to remember that the formula for finding the slope of a straight line, given two points, is:

\[ m = \frac{y_2 - y_1}{x_2 - x_1} \]

but some people forget which coordinate is \( y_1 \), which is \( y_2 \), which is \( x_1 \), and which is \( x_2 \). Here is a simple method to stop getting confused. Consider the points \((0, 0)\) and \((3, -3)\). We need to let one point be \((x_1, y_1)\) and the other be \((x_2, y_2)\). You can choose them arbitrarily: it won’t make any difference. Next, write under each point whether it is \((x_1, y_1)\) or \((x_2, y_2)\), like so:

\[
\begin{array}{cc}
(3, -3) & (0, 0) \\
\hline
x_1 & y_1 \\
x_2 & y_2 \\
\end{array}
\]

Now we can easily see which value is substituted for which coordinate and it is a simple matter to finish evaluating the slope:

\[
\frac{y_2 - y_1}{x_2 - x_1} = \frac{0 - (-3)}{0 - 3} = \frac{3}{-3} = -1.
\]

Take care with signs

The previous example showed that you have to take care with negative signs in these calculations. For example, \(1 - (-2) = 1 + 2 = 3\), and \(-4 - (-1) = -4 + 1 = -3\).

6.7 Finding the equation of a straight line

Read pages 133 – 137 of the lecture notes, and work through any examples.

Straight lines

- Be able to find the equation of a line given:
  - the gradient of the line and a point on the line,
  - two points on the line.

6.8 Parallel and perpendicular lines

Read pages 138 – 139 of the lecture notes, and work through any examples.
Parallel and perpendicular lines

- Know that for two lines with slopes $m_1$ and $m_2$ respectively:
  - if the lines are parallel, $m_1 = m_2$.
  - if the lines are perpendicular, $m_1 \times m_2 = -1$, or equivalently $m_2 = \frac{-1}{m_1}$,
    or equivalently $m_1 = \frac{-1}{m_2}$.

6.9 Measuring distance

Read pages 140 – 142 of the lecture notes, and work through any examples.

Distance

- Understand and be able to apply Pythagoras’ theorem in a triangle.
- Be able to apply the distance formula given two points.

Choosing $(x_1, y_1)$ and $(x_2, y_2)$

You may choose either point as $(x_1, y_1)$ as long as you choose the other point as $(x_2, y_2)$, as the following example illustrates:

Suppose you were required to find the straight line distance between the points $(12, 6)$ and $(9, 4)$. If you choose $(12, 6)$ as $(x_1, y_1)$ and $(9, 4)$ as $(x_2, y_2)$, you get:

$$
d = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2} \\
= \sqrt{(12 - 9)^2 + (6 - 4)^2} \\
= \sqrt{3^2 + 2^2} = \sqrt{9 + 4} = \sqrt{13}
$$

Similarly if you choose $(9, 4)$ as $(x_1, y_1)$ and $(12, 6)$ as $(x_2, y_2)$, you get:

$$
d = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2} \\
= \sqrt{(9 - 12)^2 + (4 - 6)^2} \\
= \sqrt{(-3)^2 + (-2)^2} = \sqrt{9 + 4} = \sqrt{13}
$$

which is the same answer.

Distance formula and gradient formula

Don’t get the distance formula mixed up with the gradient formula. They are different.
Finally.

To reinforce the material from this section, you should attempt the following questions from previous exam papers. Solutions to each question are included after the exam paper which contained the question.

1. Graph Qn, Page 88 (not Eqns 1,2)  
2. Section B, Qn 8, Page 89
3. Section B, Qn 9, Page 89

7 Intersecting lines; simultaneous equations

What?
In this section we encounter simultaneous equations, seeing what they are and how to solve them. We’ll see that when there are two linear equations and two unknowns, the problem can be interpreted as finding the intersection of two straight lines. We will look at how to solve such equations. We’ll concentrate on the case where there are two unknowns, although the techniques can be applied to bigger problems.

Who?
Solving simultaneous equations is one of the most important applications of mathematics, and it is regularly undertaken by engineers, physicists, economists and surveyors. Most supercomputers in the world spend a great proportion of their time solving such equations with thousands or millions of unknowns. Indeed one of the primary reasons that computers were initially developed was to solve simultaneous equations.

How?
A man buys 3 pieces of fish and 2 serves of chips for $11.20. A woman buys 1 piece of fish and 4 serves of chips for $10.40. How much does a piece of fish cost? How much does a serve of chips cost?

Why?
We need to be able to solve pairs of simultaneous equations. The intersection point of two linear functions represents an $x, y$ pair that satisfies both equations. We need to be able to determine if such an $x, y$ pair exists, and if so find their values. You will apply these techniques in subsequent courses.
At the end of this section you should be able to:

- Plot simultaneous equations on a graph and:
  - determine if the equations have an infinite number of solutions, one solution, or no solution.
  - read the solution from a graph (where possible).

- Given a pair of simultaneous equations, algebraically determine if they have an infinite number of solutions, one solution, or no solution, and if a solution exists, find it by either the substitution or elimination methods.

Work through this section as follows:

7.1 Intersections of lines.

Read pages 144 – 145 of the lecture notes, and work through any examples.

Intersections of lines

- Know that any pair of straight lines drawn on the same set of axes will intersect in either one, none or an infinite number of points.

- Know that if a pair of straight lines intersect in one point, there is precisely one pair \((x_i, y_i)\) that satisfies the equations of both lines. We say that this pair of simultaneous equations has a unique solution.

- Know that if a pair of straight lines are parallel (ie. they intersect in no points), then there is no pair \((x_i, y_i)\) that satisfies the equations of both lines. We say that this pair of simultaneous equations has no solution.

- Know that if a pair of straight lines overlay each other (ie. they intersect in every point, and are in fact the same line), then for every pair \((x_i, y_i)\) that satisfies the equation of the first line, \((x_i, y_i)\) will also satisfy the equation of the second line. We say that this pair of simultaneous equations has an infinite number of solutions.
7.2 Solving simultaneous equations

Read pages 145 – 151 of the lecture notes, and work through any examples.

Algebraic solution of simultaneous equations

- Be familiar with both the substitution and elimination methods for solving simultaneous equations.
- Be able to look at a pair of simultaneous equations and quickly decide which method is best.
- Be able to identify if there is no solution, one solution, or an infinite number of solutions.

Substitution or elimination?

Many students ask: when should I use elimination and when should I use substitution? Unless you are explicitly asked to use one method or another you may use which ever method you prefer. There are however times when substitution is clearly easier. If, in one of the equations, \(x\) or \(y\) has a coefficient of 1, it is a simple matter to rearrange this equation and isolate the variable, so substitution is the way to go. If this is not the case, and you would rather not mess around with fractions, you should use elimination.
**Substitution**

Here are the steps for substitution:

- **Choose and isolate.**
  - choose an equation and isolate one of the variables to the left-hand side.
  - the choice will usually be obvious.
  - if the choice is not obvious, then play it safe and use elimination.
- **Substitute.**
  - take the equation with the isolated variable on the left and substitute the expression that is on the right hand side of that equation, for the relevant variable in the other equation.
  - take care when substituting. Put brackets around the substituted expression to ensure correct evaluation.
- **Solve for one variable.**
  - you should now have an equation with one unknown (either $x$ or $y$). Solve the equation and find this unknown.
- **Substitute and solve.**
  - Substitute the value found in the previous step for the correct variable in either of the original equations.
  - solve this equation and find the value of the other variable.
- **Substitute and check.**
  - Substitute the $x$ and $y$ values you now have into both original equations, and check that your solution is correct.

**Elimination**

Here are the steps for elimination:

- **Eliminate one variable.**
  - add a multiple of one equation to a multiple of the other equation, thus eliminating one of the variables.
  - take care with signs when performing this step.
  - although not explicitly mentioned in the lecture notes, you can subtract one equation from another instead of adding them together. Sometimes this method is easier (of course this is the same as multiplying an equation by $-1$ and then adding the equations).

(continued on next page)
Elimination  (continued)

- Solve for one variable.
  - solve this equation to find one of the variables.

- Substitute and solve.
  - Substitute the value found in the previous step for the correct variable in either of the original equations.
  - solve this equation and find the other variable.

- Substitute and check.
  - Substitute the $x$ and $y$ values you now have into both original equations, and check that your solution is correct.

The difference between the substitution and elimination methods

Note that the only difference between the substitution method and the elimination method is the way in which we form the equation to find the first unknown.

- In the substitution method we substitute an expression for a variable, forming a new equation to find the value of the other variable.

- In the elimination method we eliminate one variable, forming a new equation to find the value of the other variable.

Checking your solutions

In both the elimination and substitution methods you will notice that the last step is to substitute and check your answers. You must get into the habit of checking your solutions. Mistakes (particularly with a misplaced sign) are easy to make. Substitute your solutions into both original equations and verify that your answers are correct. On your exam, if your answer is incorrect but you substitute and recognise that it is incorrect, you may not have time to recalculate your answer. You can recover some lost marks by demonstrating that you have substituted and checked your answers and you are aware that they are incorrect.
No solution; infinite number of solutions

You should work through the Questions in the lecture notes to understand what happens algebraically if the pair of simultaneous equations has no solution or an infinite number of solutions. Here are some general examples:

- If at any stage in the solution process you get something like
  \[ -6 = 0 \]
  then this clearly is **never true**, which means the pair of equations has **no solution**.

- If on the other hand you get something like
  \[ 5 = 5 \]
  then this clearly **always true**, which means the pair of equations has an **infinite number of solutions**.

Finally.

To reinforce the material from this section, you should attempt the following questions from previous exam papers. Solutions to each question are included after the exam paper which contained the question.

1. Section B, Question 10, Page 89
2. Section B, Question 11, Page 89
3. Section B, Question 15, Page 95
4. Section B, Question 15, Page 101
5. Section B, Question 15, Page 107
6. Section B, Question 16, Page 107
7. Question 4, Page 117
8. Question 5, Page 123
9. Question 5, Page 129
10. Question 5, Page 135
11. Question 5, Page 140
12. Question 6, Page 111
8 Functions

What?
This section gives a basic introduction to functions. We’ll investigate function notation, simple functions, and the input and output values (domain and range) that these functions can have. At the end of this section we’ll briefly cover composition of functions.

Who?
Functions are used by scientists, economists, and statisticians to describe the behaviour of complex systems such as weather prediction, share market trends, and population dynamics.

How?
The population of Mexico City has been accurately recorded for the past 100 years. Create a model based on this information that predicts the population of Mexico City in 2031.

Why?
We have seen that graphs were useful for visualising data. But graphs have their limitations. It is hard to zoom in and read fractional values from a graph, and it would be impossible to completely draw a graph that goes from $-\infty$ to $\infty$. It is often better to use functions to determine the behaviour of systems, rather than relying on graphs. We can immediately evaluate and compare given points, regardless of how far apart they are, and we can immediately achieve whatever level of accuracy we desire. Composition of functions will be important when we start differentiation (especially the chain rule).

At the end of this section you should be able to:

- Feel comfortable using function notation.
- Evaluate functions for given $x$ values.
- Accurately determine domain and range.
- Determine $f(g(x))$ and $g(f(x))$. 
8.1 Functions and function notation.

- Understand that a function must have a unique output for each input.
- Understand that a function is a mathematical rule:
  - we give it some valid input.
  - we extract a unique output.
- Be comfortable with the notation: it can seem tricky at first.

Understanding functions

Many students have trouble trying to understand functions and yet have been using them for years without even knowing it. A function is a mathematical rule, just like the one for finding the area of a circle, \( A = \pi r^2 \). We pass our function some input, in this case \( r \), the radius of a circle, and calculate the output \( A \), which is the area of a circle. We could rewrite this rule in function notation as \( f(x) = \pi x^2 \) and nothing would change, except that we now call our input \( x \) and our output \( f(x) \). The output would still be the area of a circle whose radius is \( x \).

Function notation

Many students get thoroughly confused with function notation, particularly using \( f(x) \), \( g(x) \) and \( y \). Note that for each of

\[
\begin{align*}
  f(x) &= 3x + 4 \\
  g(x) &= 3x + 4 \\
  y &= 3x + 4
\end{align*}
\]

the only difference is that the output has a different name in each case. **The value of the output does not differ.** If we let \( x = 1 \), the answer will always be 7. The functions \( f(x) \), \( g(x) \) and \( y \) are just names we give to the output. Similarly for each of

\[
\begin{align*}
  f(a) &= 3a + 4 \\
  g(u) &= 3u + 4 \\
  y &= 3x + 4
\end{align*}
\]

\( a, u \) and \( x \) are just names for the input variable. If I let \( a = 1 \) in the first equation, \( u = 1 \) in the second equation and \( x = 1 \) in the third equation, the output in each case will equal 7.
8.2 Domain and range.

Domain and range are usually expressed in interval notation. It may help to revise Section 2.5 (Intervals on the real line) before proceeding.

Read pages 157 – 165 of the lecture notes, and work through any examples.

Domain and range

- Distinguish between domain and range.
  - domain means all possible input values for a function.
  - range means all possible output values for a function.

- Be able to determine the valid domain and range for a given function and express them in interval notation.

Tips for finding the domain

Here are some tips for finding the domain of a function. Ask yourself: does the function have any square roots or fractions? If so then note that:

- the domain cannot contain any value which gives a negative inside a square root sign (you can’t find the square root of a negative number).
- the domain cannot contain any value which gives zero as the denominator of a fraction (as you can’t divide by zero).

Tips for finding the range

Here are some tips for finding the range of a function.

- Is the domain restricted? If so it may restrict the range.
- Are there any square root signs, squared indices or absolute values in the equation? If so then note that:
  - the square root of every number is always positive.
  - any number squared is always positive.
  - the absolute value of any number is always positive.

8.3 Composition of functions.

Read pages 166 – 167 of the lecture notes, and work through any examples.
Composition of functions

- You must understand composition of functions. For a given $f(x)$ and $g(x)$ you should be able to find $f(g(x))$ and $g(f(x))$.

- It is important that you are able to distinguish between $f(g(x))$ and $g(f(x))$.

Composition of functions

Students always find composition of functions hard. If you follow this simple rule it will be easier: to find $f(g(x))$, all you have to do is take the term on the right hand side of $g(x)$ and put brackets around it. Now, every time $x$ occurs in $f(x)$, replace it with the right hand side of $g(x)$ (surrounded by brackets).

For example, suppose you are told that $f(x) = -x^2 + x$ and $g(x) = x + h$ and you are asked to find $f(g(x))$. First take the term from the right hand side of $g(x)$ and put brackets around it. This gives $(x + h)$. Now, wherever there is an $x$ in $f(x)$, you replace it with $(x + h)$. This gives:

\[
\begin{align*}
    f(x) &= -x^2 + x \\
    f(g(x)) &= -(x + h)^2 + (x + h)
\end{align*}
\]

Note the brackets around $x + h$. We put them there for two reasons. Firstly, using brackets makes it absolutely clear what you are substituting for $x$ in $f(x)$. Secondly, using brackets ensures there is no ambiguity if you have to expand the composite function out later on. See if you can find $g(f(x))$.

Finally.

To reinforce the material from this section, you should attempt the following questions from previous exam papers. Solutions to each question are included after the exam paper which contained the question.

1. Section A, multichoice, Qn 1, Page 87
2. Section A, multichoice, Qn 2, Page 87
3. Section B, Qn 7, Page 89
4. Section A, multichoice, Qn 2, Page 93
5. Section A, multichoice, Qn 3, Page 93
6. Section B, Qn 10, Page 95
7. Section A, multichoice, Qn 2, Page 99
8. Section A, multichoice, Qn 3, Page 99
9. Section B, Qn 10, Page 101
10. Section A, multichoice, Qn 2, Page 105
11. Section A, multichoice, Qn 3, Page 105
12. Section B, Qn 10, Page 107
13. Qn 6, Page 117
14. Qn 4, Page 129
15. Qn 1(b),(c), 4, Page 111
16. Qn 5(b), 8, 12, Page 112
9 Quadratic equations and polynomials

What?
This section covers polynomials and, in particular, quadratic equations. Our work so far has mainly been concerned with straight lines and linear equations. We now progress a step further and look at curves and polynomial equations.

In linear equations the unknown $x$ is only raised to the power one. With polynomials, $x$ may be raised to any integer power, and the resulting graph is a curve. The simplest polynomials (apart from straight lines) contain $x$ raised to the power two (that is, $x^2$) and are called quadratics. Much of this section will be spent dealing with quadratics.

Who?
Quadratics and polynomials are an important part of mathematics. Being able to accurately model curves is an important part of the design of everything from your mobile phone or your car, or even the Sydney Harbour Bridge. Economists, mathematicians, physicists, and biologists invest much time and money trying to find polynomial equations to model fluctuations in stockmarket trends, production schedules, and species population dynamics.

How?
Traffic flow on a major intersection is measured hourly from 5:30 am to 6:30 pm every weekday for a month. The hourly totals are averaged and plotted on a graph. Find a curve which best describes the traffic flow.

Why?
Quadratics and polynomials are important to us in this course. Learning how to plot polynomials on a graph and to solve quadratic equations is a major step toward understanding the calculus components later on in this course.
At the end of this section you should be able to:

- Recognise a polynomial by its equation and determine if it is linear, quadratic, cubic or other.
- Identify the coefficients and the constant term in a polynomial equation.
- Sketch a quadratic curve from its polynomial equation.
- Determine the number of roots of a quadratic equation.
- Find the roots of a quadratic equation using the quadratic formula or factoring.
- Solve real world problems using the quadratic formula.

Work through this section as follows:

9.1 Introduction to polynomials.

Read pages 169 – 170 of the lecture notes, and work through any examples.

Introduction to polynomials

- Be able to recognise polynomials of degree one (linear equations), degree two (quadratic equations), and degree three (cubic equations).
- Be able to identify the coefficients and constant term of a given polynomial.

Constant terms

As for linear equations, the constant term of all polynomials is the $y$-intercept. For linear equations the slope was $m$, but for general polynomials the slope is more complicated.

9.2 Quadratics.

Read pages 170 – 172 of the lecture notes, and work through any examples.

Quadratics

- Know:
  - that the general form of a quadratic is $f(x) = ax^2 + bx + c$
  - that a quadratic may cross the $x$-axis two times, once, or not at all.
  - that the quadratic crosses the $x$-axis only when $y = 0$.
  - that the values of $x$ when $y = 0$ are called the roots of the equation.
9.3 Shapes of some polynomial functions.

Read pages 172 – 174 of the lecture notes, and work through any examples.

Shapes of some polynomial functions

• Know the general shape of a quadratic with \( a < 0 \) and 0, 1 or 2 roots.
• Know the general shape of a quadratic with \( a > 0 \) and 0, 1 or 2 roots.
• You must be aware of the effect of changing the values of \( a \) and \( c \).
• You should be able to sketch a variety of quadratic equations.

9.4 Solving quadratics using the Quadratic formula.

Read pages 175 – 179 of the lecture notes, and work through any examples.

Solving quadratics

• You must be able to find the roots of a quadratic using the quadratic formula.
• Know that if:
  - \( b^2 - 4ac > 0 \) the quadratic has two distinct real roots,
  - \( b^2 - 4ac = 0 \) the quadratic has one real root,
  - \( b^2 - 4ac < 0 \) the quadratic has no real roots.

Important things to note when solving quadratics

The are some important things to note when solving quadratics:

(1) The right hand side of the equation must equal zero. The quadratic formula won’t work if the equation is not written as \( ax^2 + bx + c = 0 \).

(2) Setting out can save a lot of trouble. It is a good idea to write down the values of \( a \), \( b \) and \( c \) before substituting them into the quadratic formula. As an example, find the roots of \( 2x^2 = 2x + 12 \).

First, rewrite the equation in standard form, so \( 2x^2 - 2x - 12 = 0 \). 

(continued on next page)
Important things to note when solving quadratics  

(continued)

Now \( a = 2 \quad b = -2 \quad c = -12. \)

When we substitute them into the quadratic formula we get

\[
x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}
\]

\[
= \frac{-(2) \pm \sqrt{(-2)^2 - 4 \cdot 2 \cdot (-12)}}{2 \cdot 2}
\]

\[
= \frac{2 \pm \sqrt{4 - (-96)}}{4} = \frac{2 \pm \sqrt{100}}{4} = \frac{2 \pm 10}{4}
\]

\[x = \frac{12}{4} \quad \text{or} \quad x = -\frac{8}{4} \quad \text{so} \quad x = 3 \quad \text{or} \quad x = -2\]

(3) Take extreme care with signs when substituting into the formula. In the above example we saw that \( b = -2 \) so \( -b = -(-2) = 2 \) and \( c = -12 \), so \( -4ac = -4 \times 2 \times -12 = 96. \)

9.5 Solving quadratics by factoring.

Read pages 180 – 183 of the lecture notes, and work through any examples.

Solving quadratics

• Understand the relationship between factors and roots.
• Be able to find some factors of a polynomial by trial and error.

9.6 Applications of quadratics

Read pages 184 – 185 of the lecture notes, and work through any examples.

Applications of quadratics

• Be able to construct quadratic equations from wordy problems, solve the equations and relate the answers back to the original problem.

Finally.

To reinforce the material from this section, you should attempt the following questions from previous exam papers. Solutions to each question are included after the exam paper which contained the question.

1. Qn 18, Page 125  
2. Qn 17, Page 131  
3. Qn 1(d), Page 111  
4. Qn 12(b), (c), Page 112
10 Logarithms and exponentials

What?
In this section of the course we’ll look at two special types of function: logarithms and exponentials. We’ll see the general form of exponential functions, see how they lead to exponential growth, encounter formulae for compound interest, discuss exponential decay, and then encounter a special irrational number, \(e\). Finally we’ll encounter logarithmic functions and look at a few of their properties.

Who?
Logarithms and exponents play an important part in modeling biological data, particularly population modeling. They are also an important part of statistical analysis and have applications in engineering and commerce; for example, compound interest grows exponentially. Archaeologists and palaeontologists use exponential functions when carbon dating fossils and bones.

How?
The half-life (the time taken for half of a given sample to disintegrate) of Carbon-14 is 5730 years. The bones of an ancient Iceman are found to have 50% as much Carbon-14 as a living bone. When did the Iceman roam the earth?

Why?
In many other courses at university you will encounter logarithms and exponentials, particularly if you undertake any commerce, science or engineering courses, so it is important to learn the basics about these functions here. Before electronic calculators were available, logarithms were used to solve calculations involving large numbers (particularly for engineering problems) and books containing logarithm tables were consulted when solving these problems. Today, logarithmic and exponential functions are used to model things like population dynamics, ecological and financial problems and even to encrypt electronic data.
At the end of this section you should be able to:

- Identify exponential and logarithmic functions and their graphs.
- Calculate compound interest.
- Understand exponential growth and exponential decay.
- Understand the exponential function $e^x$.
- Identify plots of $e^{kx}$ for $k$ positive and $k$ negative
- Understand natural logarithms and the notation ln $x$.

Work through this section as follows:

### 10.1 Introduction to exponentials.

Read pages 187 – 188 of the lecture notes, and work through any examples.

**Introduction to exponentials**

- Be able to identify an exponential function.
- Understand the differences between exponential and polynomial functions.

### 10.2 Exponential growth.

Read pages 188 – 192 of the lecture notes, and work through any examples.

**Exponential growth**

- Understand that $a^x$ ($a > 1$) represents exponential growth, and be able to plot graphs of such functions.
- Be clear on how exponential growth functions look for $x < 0$ and $x > 0$.
- Understand the general form of exponential growth: $y = Ca^x$, $C > 0$, $a > 1$.
- Exponential growth arises in many practical problems: be able to solve them.
10.3 Compound interest

Read pages 192 – 194 of the lecture notes, and work through any examples.

Practical problems

• Understand how the formula for compound interest arises: if $P$ earns a rate of $r$ per time period for 1 time period, then the new balance will be $F = P(1 + r)$ (this is easy to see. For example, if $P = 100$ and $r = 10\% = 0.1$, then the final balance will be $F = 100(1 + 0.1) = 110$.)

• After another time period it will be $(1 + r)$ times what it was, so will be $F = P(1 + r)^2$ (here, $F = 100(1 + 0.1)^2 = 121$).

• This continues for each time period, so after $n$ time periods, $F = P(1 + r)^n$.

10.4 Exponential decay.

Read pages 195 – 198 of the lecture notes, and work through any examples.

Exponential decay

• Understand that $a^x$ ($0 < a < 1$) represents exponential decay, and be able to plot graphs of such functions.

• Be clear why we can rewrite $a^x$ ($0 < a < 1$) in the form $b^{-x}$ for $b > 1$.

• Understand the general form of exponential decay: $y = Ca^{-x}$, $C > 0$, $a > 1$.

• Be able to explain the similarities and differences between exponential growth functions, and exponential decay functions.

• Our main use for exponential decay functions is for solving practical problems involving radioactive decay, population decline and inflation.

10.5 The exponential function, $e^x$

Read pages 199 – 203 of the lecture notes, and work through any examples.
The exponential function, $e^x$

- $e$ is a very important number; from now on we will almost exclusively talk about exponentials in terms of $e$, as we can rewrite any exponential function with any base $a$ as an exponential with base $e$.

- Understand the general form of exponential functions: $y = Ce^{kx}$, $k \neq 0$, $C > 0$.

- $e$ has many important properties: one is the way it arises in problems involving continuous compounding.

- You do not need to remember the value for $e$, but you must be comfortable with using it in exponential functions. Remember that $e$ is irrational (like $\pi$).

Evaluating $e^x$

Mostly you will not need to evaluate $e^x$. However, there is one case when you should evaluate $e^x$ and that is when $x = 0$. Remembering that anything raised to the power zero equals 1, you should always rewrite $e^0$ as 1.

$e^x$ is always positive

From the graphs of $e^x$ and $e^{-x}$, we see that both of them are always positive (as they do not cross the $x$-axis). This is a very useful fact to remember: $e^x$ and $e^{-x}$ are never equal to 0 or negative!
10.6 Logarithms

Read pages 204 – 207 of the lecture notes, and work through any examples.

Logarithms

- Logarithms are simply inverse functions of exponential functions: just as \( x^2 \) and \( \sqrt{x} \) have opposite effects, so too do \( e^x \) and \( \ln x \).
- You don’t need to remember anything about logarithms to any base besides \( e \): that is; we will look further at \( \ln x \) in this course, but not at \( \log_a x \) for any other base \( a \).
- Be aware that if \( y = e^x \) then \( x = \ln y \).

Finally.

To reinforce the material from this section, you should attempt the following questions from previous exam papers. Solutions to each question are included after the exam paper which contained the question.

1. Question 15, Page 119
2. Question 1(e),(f),(g), Page 111
3. Question 9, Page 112
11  Miscellaneous non-linear functions

What?
This is a very short section in which we encounter a few more non-linear functions. The main topic we cover is the equations and graphs of circle.

Who?
Non-linear functions are extensively used in modelling, approximating data and designing equipment and processes.

How?
Given three points, find the equation of a circle that passes through all of the points.

Why?
The main reason we study circles is because we use them to develop trigonometry and the trigonometric functions in the next section.

At the end of this section you should be able to:
- Be able to sketch certain non-linear functions and state their domain and range.
- Recognise the equation of a circle.

Work through this section as follows:

11.1  Non-linear functions.

Read pages 209 – 212 of the lecture notes, and work through any examples.
Non-linear functions

- Be able to recognise graphs of \( y = x^3 \), \( y = \sqrt{x} \), \( y = 1/x \), \( y = |x| \) and \( y = -|x| \).
- Understand how to find the domain and range of these functions.

Choosing the correct \( x \)-values

When calculating some points to plot a graph, it is often difficult to decide what values to pick for \( x \). Here are some tips:

- Non-linear equations usually require many points.
- \( x = 0 \) is usually a safe and easy choice (as long as it does not make the denominator of a fraction zero).
- Choose values that give integer answers, wherever possible.
- If \( y \)-values change rapidly, choose \( x \)-values close together.
- Don’t be afraid to choose negative \( x \)-values.
- Rather than just choosing \( x \)-values and calculating corresponding \( y \)-values, you can instead choose \( y \)-values and calculate corresponding \( x \)-values. For example, \( y = 0 \) is sometimes a sensible choice.

11.2 Circles.

Read pages 213 – 216 of the lecture notes, and work through any examples.

Circles

- Know that a circle with radius \( r \) and centre \((0, 0)\) has equation \( x^2 + y^2 = r^2 \).
- Be familiar with the equation of a circle with centre \((a, b)\) and radius \( r \).
- Be aware that a unit circle is a circle with centre \((0, 0)\) and radius 1.

Finally.

To reinforce the material from this section, you should attempt the following questions from previous exam papers. Solutions to each question are included after the exam paper which contained the question.

1. Graph Qn, Page 88  (Eqns 1,2)  2. Graph Qn, Page 94  (Eqns 5,6)
3. Graph Qn, Page 100  (Eqns 3,6)  4. Graph Qn, Page 106  (Eqns 1,4,7)
5. Qn 12, Page 118  (Eqns 1,2,4,8)  6. Qn 17, Page 119
7. Qn 13, Page 124  (Eqns 1,5,6)  8. Qn 13, Page 131  (Eqns 1,5,6)
9. Qn 16, Page 136  (Eqns 3,5,6)  10. Qn 15, Page 141  (Eqns 2,5,6)
12  Trigonometry

What?
Trigonometry is the study of angles, and is one of the oldest fields of mathematical study. It has its origins in astronomy and is said to have originated in ancient Greece in the third century B.C. It is still one of the most widely used applications of mathematics today. Every man-made structure uses some trigonometry. In this course we’ll encounter angles, trig functions ($\sin \theta$, $\cos \theta$, and $\tan \theta$), degrees and radians, and then see how the trig functions become periodic functions.

Who?
Trigonometry is used extensively by surveyors, engineers, sailors and military personnel. It has applications in civil engineering, such as in the construction of buildings, roads and bridges. It is also essential for navigation and in the military (such as for aiming artillery). Economists also use periodic functions (like the trig functions) to model many phenomena.

How?
Two trees on a bank of a straight river are 25 metres apart. I am standing on the other bank, directly opposite the first tree. The angle formed by the first tree, myself and the second tree is exactly $45^\circ$. How wide is the river crossing?

Why?
A basic knowledge of trigonometry is useful to everyone. You may use it when building a fence, putting up a shelf, designing a garden at home, or perhaps sailing a yacht from Sydney to Hobart. This course provides an introduction to trigonometry, starting with some basic trigonometric rules that you may be familiar with, and moving on to harder and perhaps more unfamiliar material. Some of the material you encounter here will be useful later on in the calculus portion of this course.
At the end of this section you should:

- Understand some basic facts about angles and triangles.
- Be able to identify the sides of a right angle triangle.
- Know the definitions of: $\sin \theta$, $\cos \theta$, $\tan \theta$.
- Be able to use some special triangles to evaluate trig functions for some common angles.
- Understand the relationship between the radius of a circle and one radian.
- Be able to convert degrees to radians and radians to degrees.
- Be able to identify the graphs of $\sin x$, $\cos x$, and $\tan x$.
- Know the effect of varying $a$ and $b$ on the graph of $a \sin bx$.

Work through this section as follows:

### 12.1 Introduction to trigonometry.

Read pages 218 – 219 of the lecture notes, and work through any examples.

**Introduction to trigonometry**

- Understand the meaning of the terms: *angle*, *acute angle*, *obtuse angle*, *isosceles triangle*, *equilateral triangle*, *right angle triangle*.
- Know that the sum of the angles in a triangle is $180^\circ$.
- In a right angle triangle with a given angle $\theta$, be able to identify the hypotenuse, adjacent side, opposite side.
- Know the definitions of: $\sin \theta$, $\cos \theta$, $\tan \theta$. (Note: $\theta$ is a Greek letter, pronounced ‘theta’, and is often used to represent an angle.)

**Remembering the formulae for $\sin \theta$, $\cos \theta$, and $\tan \theta$.**

There are many little rhymes for remembering the formulae for finding $\sin \theta$, $\cos \theta$, and $\tan \theta$. Most rely on substituting a word for a major component of the formulae to form a verse. Here is one:

some old hippies can act happy tripping on acid.

From the first letter in each word of this we get:

$$
\sin \theta = \frac{\text{opposite}}{\text{hypotenuse}} \quad \cos \theta = \frac{\text{adjacent}}{\text{hypotenuse}} \quad \tan \theta = \frac{\text{opposite}}{\text{adjacent}}
$$
12.2 Evaluating $\sin \theta$, $\cos \theta$ and $\tan \theta$.

Read pages 219 – 220 of the lecture notes, and work through any examples.

Evaluating $\sin \theta$, $\cos \theta$ and $\tan \theta$

- Know how to use an isosceles triangle to derive $\sin 45^\circ$, $\cos 45^\circ$, and $\tan 45^\circ$,
  (note that $45^\circ = \pi/4$ radians).

- Know how to use an equilateral triangle to derive $\sin 30^\circ$, $\cos 30^\circ$, and $\tan 30^\circ$,
  (note that $30^\circ = \pi/6$ radians), $\sin 60^\circ$, $\cos 60^\circ$, and $\tan 60^\circ$,
  (note that $60^\circ = \pi/3$ radians).

12.3 Radians.

Read pages 221 – 222 of the lecture notes, and work through any examples.

Radians.

- Understand the relationship between the radius of a circle and one radian.
- You should be able to convert degrees to radians.
- You should be able to convert radians to degrees.
- You should know that $2\pi$ radians = $360^\circ$, the number of degrees in a circle.

Calculators and degrees

Your scientific calculator should know all about degrees. It may however have a button for entering degrees, minutes and seconds. You don’t need to worry about this. All degree measurements in this course will be in decimal form. If you enter values in decimal then you should obtain correct answers.

Calculators and radians

If you are using your calculator to evaluate trig functions in radians, you must ensure that the correct mode is set. If you have a scientific calculator your display will probably show “deg” if you are in degree mode and “rad” if you are in radians mode (it may even have a “grad” mode which is not used in this course). You should consult the book that came with your calculator and learn how to switch modes. Trying to solve problems in radians on a calculator set to degrees is a sure way to get incorrect answers every time.
Calculators and \( \pi \)

Your scientific calculator will probably have a button which gives you the value of \( \pi \). Unless you are explicitly told to use some approximate value for \( \pi \), (probably 3.14), you should use the \( \pi \) button on your calculator. Contrary to what you may have been told at school, \( \pi \) does not equal \( \frac{22}{7} \).

12.4 **Angles bigger than** \( \frac{\pi}{2} \) \((90^\circ)\).

Read pages 222 – 225 of the lecture notes, and work through any examples.

**Angles bigger than** \( \frac{\pi}{2} \) \((90^\circ)\)

- Remember that we always start measuring our angles from the positive \( x \)-axis, with larger angles being further around the circle **anticlockwise**.
- Remember that \( 360^\circ \) is one full (anticlockwise) rotation of a circle.
- Remember that negative angles mean the angle is measured clockwise.
- Know in which quadrants \( \sin x \), \( \cos x \) and \( \tan x \) are positive.

12.5 **Graphs of** \( \sin x \), \( \cos x \), and **\( \tan x \)**.

Read pages 226 – 231 of the lecture notes, and work through any examples.

**Graphs of** \( \sin x \), \( \cos x \), and **\( \tan x \)**

- Know that the **range** of the graphs of \( \sin x \) and \( \cos x \) is \([-1, 1]\).
- Be able to identify the graphs of \( \sin x \), \( \cos x \), and \( \tan x \).
- Understand the meaning of the terms: **amplitude**, **frequency**.
- Understand the effect of varying \( a \) and \( b \) on the graph of \( a \sin bx \).

Finally.

To reinforce the material from this section, you should attempt the following questions from previous exam papers. Solutions to each question are included after the exam paper which contained the question.

1. Question 7, Page 117
2. Question 11, Page 124
3. Question 16(b), Page 125
4. Question 11, Page 130
5. Question 14, Page 135
6. Question 13, Page 140
13 Derivatives and rates of change

What?
Being able to find the slopes of many functions is incredibly useful. It is so important that there is a special name for it: the slope of a function is called its derivative, and the process of finding a derivative is called differentiation. In this section we’ll see how to rapidly find the derivatives of many functions, by applying some special rules. Then we’ll see how to find the second derivative of a function.

Who?
Finding derivatives and calculating rates of change is an important skill for mathematicians, statisticians, hydrologists, biologists, engineers, physicists and economists. For example, in microeconomics you’ll study marginal cost and marginal revenue curves. These are all derivatives.

How?
A worker in a factory works on the 3 pm to 11 pm shift. If her production is plotted on a graph it can be described by the function \( p = -t^2 + 14t - 33 \). At what time during the shift is the rate of production increasing the fastest? At what time is the rate of change zero? At what time is the rate of production decreasing the fastest? Give a possible explanation for these answers.

Why?
In Section 5 we looked at the slope of straight lines. In this section we learn some rules which allow us to find the slopes of a wide range of functions, including some quite complex functions.
At the end of this section you should be able to:

• Understand what the derivative represents.

• Use and understand the notation \( f'(x) \).

• Correctly identify the appropriate rule for differentiation.

• Find the derivatives of a variety of functions by using a combination of the rules for differentiation.

• Find the value of the derivative of a function at a given point.

Work through this section as follows:

13.1 Differentiation and derivatives.

Read page 233 of the lecture notes, and work through any examples.

Differentiation and derivatives

• Be familiar with the terms:
  
  • differentiate, differentiable, and differentiation.
  
  • derive, derivable, and derivative.
  
  • \( f'(x), \frac{dy}{dx} \)

• Be able to evaluate the derivative of a function at a given point.

Confusing notation

Don’t be confused by all the different notation used to define the derivative of a function. This notation is all interchangeable. For example, if

\[ f(x) = y = 2x^2 + 4x + 9 \]

then the derivative of this function can be expressed as any of:

• \( f'(x) \), \( y' \), \( \frac{dy}{dx} \), \( \frac{d}{dx} (2x^2 + 4x + 9) \) or \( 4x + 4 \).
13.2 Interpreting derivatives

Read pages 234 – 237 of the lecture notes, and work through any examples.

Interpreting derivatives

• Be quite clear on the meaning of derivatives.
• Be able to describe the graph of a function from the graph of its derivative.
• Be able to look at the function and derivative and explain the relationship between them.

Distinguishing the graph of a function from the graph of its derivative

On an exam you may be presented with a question like this:

*The following set of axes contain the graph of a function and the graph of the derivative of the function. Identify which graph represents the function, and which graph represents the derivative. Explain your answer.*

This may seem a daunting task, but if you apply what you know about derivatives, you will find it is quite easy. Remember that the derivative represents the slope of the function. This means that whenever the slope of the original function is positive (runs uphill), the graph of the derivative must be positive (the graph of the derivative must lie above the x-axis). Whenever the slope of the original function is negative (runs downhill), the graph of the derivative must be negative (the graph of the derivative must lie below the x-axis). Finally, whenever the slope of the original function is zero (changing from uphill to downhill or downhill to uphill) the graph of the derivative must be zero (the graph of the derivative cuts the x-axis).
Let’s use this information to examine the two graphs. Start with Graph A. Graph A starts off with a negative slope, so if B were the derivative of A, then anywhere A has a negative slope B should be negative (lie below the \( x \)-axis). But it doesn’t; for example look near the very left-hand edge. So B is not the derivative of A, and since you are told that one graph is the function and one graph is the derivative, then A must be the derivative of B. On an exam you could write: “Graph B is the function. Graph A is the derivative. Graph B is not negative whenever A has negative slope, so B cannot be the derivative of A.”

But what if you started with Graph B? Then you would have found that everywhere B has positive slope A is positive, everywhere B has negative slope A is negative and everywhere B has zero slope A is zero (you should verify this by inspection), so A must be the derivative of B.

### 13.3 Simple differentiation

Read pages 238 – 241 of the lecture notes, and work through any examples.

#### Rules for simple differentiation

- You must know and be able to apply the rules for simple differentiation.
- These rules are very important; make sure you are completely comfortable with them.
- You must become very fast at correctly differentiating polynomials.
- Given a function like \( y = 6x^3 + 2x^2 - 4x + 1 \), you should be able to immediately determine \( y' \), almost without thinking.

#### The derivative of \( x^n \) used in unexpected ways

The rule for finding the derivative of \( x^n \) (\( n \neq 0 \)) is: \[
\frac{d}{dx} x^n = nx^{n-1}.
\]

This rule is quite easy to apply for obvious cases like finding the derivative of \( x^4 \): all you need to do is find \( n \) and substitute it into the formula to get your answer. There are some cases where it is not so obvious that this rule should be used, but as we shall see, once we have determined that we should use this rule, the technique doesn’t change. **Always identify \( n \) and substitute it into the formula to get your answer.**

Example 1: Find the derivative of \( \sqrt{x} \).

Remembering the power rules, we can rewrite \( \sqrt{x} \) as \( x^{1/2} \), so \( n = 1/2 \) and we substitute into the formula to obtain our answer.

Example 2: Find the derivative of \( x^{-4} \).

Here \( n = -4 \) (don’t leave off the minus sign) and we can substitute \(-4\) into the formula to obtain an answer.

Example 3: Find the derivative of \( \frac{1}{x^4} \).

Again remembering our power laws we can rewrite \( \frac{1}{x^4} \) as \( x^{-4} \) and we have the same situation as in Example 2.
13.4 Derivatives of some common functions

Derivatives of some common functions

- You must know the derivatives of $\sin x$, $\cos x$, $-\sin x$, $-\cos x$, $e^x$ and $\ln x$.

Derivatives of $\sin x$, $\cos x$, $-\sin x$, and $-\cos x$

You need to remember the derivatives of $\sin x$, $\cos x$, $-\sin x$, and $-\cos x$. Fortunately this is not too difficult if you remember that the derivatives follow the rules:

- The derivative of $\sin x$ is $\cos x$,
- the derivative of $\cos x$ is $-\sin x$,
- the derivative of $-\sin x$ is $-\cos x$,
- the derivative of $-\cos x$ is $\sin x$,

and the process starts again. One way to remember this is:

$\sin x$ goes to $\cos x$ goes to $-\sin x$ goes to $-\cos x$ (which goes to $\sin x$)

or you might like to try and remember this picture:

```
\begin{align*}
\sin x &\quad \rightarrow \quad \cos x \\
-\cos x &\quad \rightarrow \quad -\sin x \\
\end{align*}
```

Derivative of $e^x$

Note that $e^x$ is a special function, in that if you differentiate it, you get the same thing back. Many students get confused when differentiating $e^x$: they say to themselves ‘I know that if $y = x^3$ then $y' = 3x^2$: I need to subtract 1 from the power’. This is perfectly correct, because $x$ is in the base. Then they look at $e^x$, and say ‘I still need to subtract 1 from the power’. This is completely wrong: the difference is that $x$ is in the power, not the base. The only rule you need to use when differentiating $e^x$ is that you get the same thing back: if $y = e^x$ then $y' = e^x$. This is the easiest differentiating you will ever have to do!

13.5 Product rule.

Product rule.
Product rule
- You must be able to apply the product rule to find the derivative of a function.
- Be able to expand a function and differentiate it to show that the product rule works.

Using the product rule
Here are the steps involved with applying the product rule.

1. Be able to identify when to use the product rule.
2. Be able to identify $u$ and $v$.
3. Be able to find $u'$ and $v'$.
4. Substitute 2 and 3 above into the product rule formula to find the derivative.

Using the product rule (an example)
Example: find the derivative of $y = x^2 \sin x$.

1. Decide whether you need to use the product rule.
   Ask yourself these two questions:
   - Does the function contain at least two terms, each containing an $x$?
   - Are these terms multiplied together (is there a product)?
   If the answer to both questions is yes then you should use the product rule.
   The example contains two terms with $x$ in them. They are $x^2$ and $\sin x$. These terms are multiplied together, so you need to use the product rule.

2. Identify $u$ and $v$.
   By convention, $u$ is the first term of the product and $v$ is the second term in the product. In this example you should write:
   
   $u = x^2 \quad v = \sin x$

3. Find $u'$ and $v'$.
   Using the rules from the previous section you get:
   
   $u' = \frac{du}{dx} = \frac{d}{dx} (x^2) = 2 \times x^{(2-1)} = 2x$
   
   $v' = \frac{dv}{dx} = \frac{d}{dx} (\sin x) = \cos x$

4. Substitute into the product rule formula to find the derivative.
   
   $f'(x) = u'v + v'u = 2x \cdot \sin x + \cos x \cdot x^2 = 2x \sin x + x^2 \cos x$
13.6 Quotient rule.

Read pages 249 – 250 of the lecture notes, and work through any examples.

Quotient rule

• You must be able to apply the quotient rule to find the derivative of a function.

Using the quotient rule

Here are the steps to using the quotient rule.

1. Be able to identify when to use the quotient rule.

2. Be able to identify $u$ and $v$.

3. Be able to find $\frac{du}{dx}$ and $\frac{dv}{dx}$.

4. Substitute the results from Steps 2 and 3 into the quotient rule formula to find the derivative.

5. Simplify your answer if required.

Using the quotient rule (an example)

Example: find the derivative of $\frac{x^2 + 5}{x^2}$ and simplify your answer.

1. Decide whether you need to use the quotient rule.

   Ask yourself these two questions:

   • Does the problem have a quotient (is one term divided by another)?
   • Is there an $x$ in both terms of the quotient?

   If the answer is yes to both questions then you should use the quotient rule.

2. Identify $u$ and $v$.

   When applying the quotient rule, $u$ is always the numerator and $v$ is always the denominator. You should write down $u$ and $v$. In this example you have: $u = x^2 + 5$ and $v = x^2$.

3. Find $\frac{du}{dx}$ and $\frac{dv}{dx}$:

   \[
   \frac{du}{dx} = \frac{d}{dx} (x^2 + 5) = \frac{d}{dx} (x^2) + \frac{d}{dx} (5) = 2x^2 - 1 + 0 = 2x
   \]

   \[
   \frac{dv}{dx} = \frac{d}{dx} (x^2) = 2x
   \]

   (continued over)...
4. Substitute 2 and 3 above into quotient rule formula to find derivative:

\[
\frac{d}{dx} \frac{u}{v} = \frac{\frac{du}{dx} \cdot v - u \cdot \frac{dv}{dx}}{v^2} = \frac{2x \cdot x^2 - (x^2 + 5) \cdot 2x}{(x^2)^2}
\]

5. Simplify your answer if required:

\[
\frac{2x \cdot x^2 - (x^2 + 5) \cdot 2x}{(x^2)^2} = \frac{2x(x^2 - (x^2 + 5))}{x^4} = \frac{2(x^2 - (x^2 + 5))}{x^3} = \frac{2(x^2 - x^2 - 5)}{x^3} = \frac{2(-5)}{x^3} = \frac{-10}{x^3}
\]

13.7 Chain rule.

Read pages 251 – 256 of the lecture notes, and work through any examples.

Chain rule

- You must be able to identify when the chain rule is appropriate, then apply it in order to find the derivative of a function.

- Remember that if \( y = e^{kx} \), then \( \frac{dy}{dx} = ke^{kx} \), for \( k \) a constant.

Using the chain rule

Many students find the chain rule pretty tricky. Here are the steps involved with applying the formula.

1. Be able to identify when to use the chain rule.

2. Be able to identify \( u \).

3. Be able to find \( \frac{dy}{du} \) and \( \frac{du}{dx} \).

4. Substitute the result from Step 3 into the chain rule formula to find derivative.

5. Back substitute for \( u \) to tidy up.
Using the chain rule (an example)

Example: find the derivative of \( y = (x^2 + 10)^{12} \).

1. Decide whether you need to use the chain rule.
   Ask yourself this question:
   - Is the function I am given a composite function, that is, is it a function which contains a function? (Composite functions are covered in Section 8.3; go back and review them now if you need to.)

   If the answer is yes then you should use the chain rule.
   Here, \( y = (x^2 + 10)^{12} \) is a composite function. Let \( g(x) = x^{12} \) and \( h(x) = (x^2 + 10) \) and note that \( y = (x^2 + 10)^{12} = g(h(x)) \). So you should use the chain rule.

2. Identify \( u \).
   \( u \) is always the inside part of the composite function. In this case \( u = (x^2 + 10) \).
   Once you have identified \( u \) you should write down what it is and also rewrite the original function substituting in \( u \). In this example we have:
   \[
   u = x^2 + 10 \quad y = u^{12}
   \]

3. Find \( \frac{dy}{du} \) and \( \frac{du}{dx} \).
   \( \frac{dy}{du} \) is the rewritten original function derived with respect to \( u \) (you just treat the \( u \) like an \( x \) and use the normal derivative rules), and \( \frac{du}{dx} \) is just the normal derivative of \( u \). For the example here you should get:
   \[
   \frac{dy}{du} = \frac{d}{du}(u^{12}) = 12 \times u^{11} = 12u^{11}
   \]
   \[
   \frac{du}{dx} = \frac{d}{dx}(x^2 + 10) = \frac{d}{dx}(x^2) + \frac{d}{dx}(10) = 2 \times x^{2-1} + 0 = 2x
   \]

4. Substitute the above into the chain rule formula:
   \[
   \frac{dy}{dx} = \frac{dy}{du} \times \frac{du}{dx} = 12u^{11} \times 2x = 2x \cdot 12 \cdot u^{11} = 24x \cdot u^{11}
   \]

5. Back substitute for \( u \) to tidy up.
   From before, \( u = (x^2 + 10) \) so:
   \[
   24x \cdot u^{11} = 24x(x^2 + 10)^{11}
   \]
Evaluating the derivative at a given point

Many students master the rules for differentiation but have difficulty understanding what it is they have actually found and how to use it. Remember that the derivative is just the slope, and for curves the slope is always changing. To evaluate the slope somewhere on the function (at a given point \((x_1, y_1)\)), we find \(f'(x_1)\), which is the derivative evaluated at \(x_1\). We simply substitute the value of \(x_1\) into the derivative \(f'(x)\). The value of \(f'(x_1)\) gives us the value of the derivative at the point \((x_1, y_1)\), which is the slope of the function at the point \((x_1, y_1)\).

13.8 Second derivatives

Read pages 257 – 258 of the lecture notes, and work through any examples.

Second derivatives

- Know that the following things are all the same: second derivative, \(f''(x)\), \(\frac{d^2y}{dx^2}\).
- Be able to evaluate the second derivative of a function at a given point.

Finally.

To reinforce the material from this section, you should attempt the following questions from previous exam papers. Solutions to each question are included after the exam paper which contained the question.

1. Qn 10, Page 118  
2. Qn 11, Page 118
3. Qn 16(a), (c), Page 119  
4. Qn 10, Page 124
5. Qn 17(a),(c), Page 125  
6. Qn 10, Page 130
7. Qn 16(a),(c), Page 131  
8. Qn 10(a), Page 135
9. Qn 11, Page 135  
10. Qn 12, Page 135
11. Qn 20, Page 136  
12. Qn 9(a), Page 140
13. Qn 10, Page 140  
14. Qn 11, Page 140
15. Qn 19(a),(c), Page 141  
16. Qn 13, Page 112
14 Applications of derivatives

What?
In the previous section we learned some basic rules for finding derivatives. Now we’re going to see how derivatives can be used to solve a variety of important problems. We’ll start by looking at tangent lines to functions, then we’ll see how derivatives relate to displacement, velocity and acceleration. We’ll see how the second derivative can help with maximising and minimising functions. Finally, we’ll look at some interesting practical problems.

Who?
Derivatives are very important in almost any technical field. They enable functions to be maximised or minimised. Businesses might use derivatives in order to maximise profits or minimise costs. Vehicle designers use derivatives to analyse acceleration and deceleration. Materials engineers use derivatives to optimise use of resources.

How?
A farmer has 100 metres of fencing material. What is the largest rectangular area she can enclose?

Why?
Derivatives and their applications are probably the most important section of this course, and are the reason why most of you are made to enroll in this course. Being able to apply these techniques is very important in a wide range of areas of study.

You must have a good grasp of Section 13, (Derivatives and rates of change), before proceeding; revise that material if you need to. We also cover tangent lines, so you may find it beneficial to revise Section 6 (Graphs and straight lines) as well.
At the end of this section you should be able to:

- Find the equation of a line tangential to a curve at a given point.
- Understand that the derivative of displacement is velocity and the derivative of velocity is acceleration.
- Find and classify all critical points for a given function.
- Apply your knowledge of first and second derivatives to solving real world problems.

Work through this section as follows:

14.1 **Tangent lines.**

Read pages 260 – 262 of the lecture notes, and work through any examples.

**Tangent lines**

- Be able to find the equation of line tangential to a curve at a given point. This requires you to differentiate, then apply the theory of straight lines.

14.2 **Derivatives and motion.**

Read pages 263 – 267 of the lecture notes, and work through any examples.

**Derivatives and motion**

- Understand the relationship between displacement, velocity and acceleration.
- Given a function for displacement, be able to find velocity and acceleration at any time $t$.

14.3 **Local maxima and minima.**

Read pages 268 – 273 of the lecture notes, and work through any examples.
Local maxima and minima

- Understand the meaning of the term *critical point*.
- Know that a critical point occurs when the derivative is zero.
- Understand the first derivative test.
- Be able to recall and apply the second derivative test to classify critical points.

### 14.4 Some practical problems.

Read pages 274 – 281 of the lecture notes, and work through any examples.

**Some practical problems**

- Be able to use first and second derivatives to solve practical problems.

**Finally.**

To reinforce the material from this section, you should attempt the following questions from previous exam papers. Solutions to each question are included after the exam paper which contained the question.

1. Qn 8(b), Page 118  
2. Qn 9, Page 118  
3. Qn 16(b),(d), Page 119  
4. Qn 9(b),(c), Page 123  
5. Qn 12, Page 124  
6. Qn 17(b),(d), Page 125  
7. Qn 9(b),(c), Page 129  
8. Qn 12, Page 130  
9. Qn 16(b),(d), Page 131  
10. Qn 10(b), Page 135  
11. Qn 13, Page 135  
12. Qn 15, Page 136  
13. Qn 9(b), Page 140  
14. Qn 12, Page 140  
15. Qn 14, Page 141  
16. Qn 19(b),(d), Page 141  
17. Qn 14, 17, Page 112.
15 Integration

What?
In the last two sections we looked at differentiation. In each case we started with a function, and found its derivative. Now we look at the reverse process: starting with a derivative, can we find the original function, and is this interesting? The answer to all of these questions is yes, and the process is called integration. In this course we’ll see how to integrate some simple functions, and we’ll see a few ways in which this is very useful.

Who?
Even though integrals can be difficult to find, they have extremely important applications in science, engineering, and finance.

How?
A rocket takes off at time $t = 0$ with velocity $3t^2 + 2t$. At time $t = 3$, the rocket’s displacement is 46 metres. Find an expression for the rocket’s displacement at any time $t$.

Why?
Many later-year university courses, particularly in mathematics, engineering and commerce, will involve integration, so it is important that you learn the basics here.

At the end of this section you should be able to:

- Understand the terms: indefinite integral, definite integral, antiderivative, constant of integration, limits of integration, initial conditions, area under the curve.
- Understand the notation $\int f(x)dx$ and $\int_a^b f(x)dx$.
- Understand and apply some rules for integration.
- Find indefinite integrals of some simple functions.
- Evaluate definite integrals and find the area under the curve.
- Use integration to solve some simple physical problems.
Work through this section as follows:

15.1 Introduction to integration.

Read pages 283 – 285 of the lecture notes, and work through any examples.

Introduction to integration
- Understand the meaning of the terms: integration, integral, indefinite integral, antiderivative, constant of integration.
- Understand that integrating is the reverse step to differentiating.
- Be familiar with the notation $\int f(x)\,dx$.
- Be able to integrate the examples in the notes (remember, these are indefinite integrals, so you need to add $C$, the constant of integration).

Checking your integral
You should always check any integral that you find. All you need to do is find the derivative of the integral and compare it with the function you were supposed to integrate. If they are the same then you have integrated the function successfully. (Don’t forget that the derivative of $C$ (the constant of integration) is zero.)

15.2 Rules for integration.

Read pages 286 – 289 of the lecture notes, and work through any examples.

Rules for integration
- Be able to apply the rules for integration to find indefinite integrals.
- Note that each of these rules matches a related rule for differentiation.

Applying Rule 1
Students often have difficulty applying some of the rules for integration in the notes, in particular Rule 1. This rule says:

$$\int x^n\,dx = \frac{1}{n+1}x^{n+1} + C$$

This may look difficult, but it is just the reverse of the rule for differentiating $x^n$. All you need to do to apply this rule is to identify $n$ and substitute it into the formula to get your answer.
15.3 **Initial conditions.**

Read pages 289 – 290 of the lecture notes, and work through any examples.

**Initial conditions**
- Be able to find the exact value of \( C \) (the constant of integration) if you are supplied with initial conditions.

15.4 **Definite integrals and areas.**

Read pages 291 – 296 of the lecture notes, and work through any examples.

**Definite integrals and areas**
- Understand the meaning of the terms: *area under the graph, definite integral, limits of integration.*
- Be familiar with the fundamental theorem of calculus.
- Understand how a definite integral differs from an indefinite integral.
- Understand what happens to the constant of integration when you evaluate a definite integral.
- Be able to apply what you know about definite integrals to finding the area under the curve for a specified interval.

15.5 **Integrals and motion.**

Read pages 297 – 299 of the lecture notes, and work through any examples.
Integrals and motion

- Be able to use integrals to solve physical problems.

- These relationships are simply the reverse of the relationships we saw when studying derivatives. Velocity is the derivative of displacement, so displacement is the integral of velocity. Similarly, acceleration is the derivative of velocity, so velocity is the integral of acceleration.

- Given a function for acceleration and some initial conditions, be able to find velocity and displacement at any time \( t \).

Finally.

To reinforce the material from this section, you should attempt the following questions from previous exam papers. Solutions to each question are included after the exam paper which contained the question.

1. Qn 13, Page 119  
2. Qn 14, Page 119  
3. Qn 14, Page 125  
4. Qn 15, Page 125  
5. Qn 14, Page 131  
6. Qn 15, Page 131  
7. Qn 17, Page 136  
8. Qn 18, Page 136  
9. Qn 19, Page 136  
10. Qn 16, Page 141  
11. Qn 17, Page 141  
12. Qn 18, Page 141  
13. Qn 15, 16, 18, Page 112
16 Previous exams and exam techniques

This section should help you to prepare for your MATH1040 exams. In Section 16.1 we make some suggestions on how to approach the exams. Then we give some previous midsemester exam papers and final exam papers for MATH1040. Solutions are also given for all the questions. Of course, the format and style of your exam may vary from these copies, but these will give you a great idea of what to expect. The MATH1040 lecturer should tell you exactly what your paper looks like, and how it compares to these.

In this section we have given you the following exams and solutions. Note that on the real exam papers there is much more space for your writing! Note also that the final exam often includes a formula sheet; your lecturer can show you exactly what your exam will include.

Note that your final exam will probably be out of 120 marks. In the exams and solutions we have given here, we have deleted some questions containing material which is no longer part of the course. That is why the exam papers here are worth strange numbers of marks!
16.1 Possible exam techniques

Let’s talk about exam technique. Some of these points may be useful: adopt them if you like. This is all personal opinion (having sat many many Uni exams). If you have a method which works for you, use it.

- Don’t panic! Look at how long you have to do the paper (90 minutes midsemester, 120 minutes final exam). This is a long time, so expect things to take awhile.
- You don’t have to do the whole paper. Try to, but if you can’t do some bits, that’s not a disaster.
- Use perusal carefully. It’s 10 very important, bonus minutes. You might like to
  - write down, on the blank page, some things which you have committed to memory.
  - quickly look through the paper, to see which bits you can or cannot do, and to work out where you are going to start.
  - if you have time, you could start working out some answers, on the blank sheet, not on the exam paper. Do questions which you are good at and which are worth lots of marks.
- I think the first 2 of those perusal actions are more important than the 3rd. Use perusal to collect your thoughts, relax, work out where you’re going to start, and write down facts you’re likely to forget.
- The exam is similar to the sample, but not identical. Don’t just re-write the answer to the question on the sample!
- Always start with the easy bits (those bits you can do).
- This ‘guarantees’ you marks, boosts the confidence, and doesn’t run the risk of spending too long on a hard question.
- You don’t have to start at question 1: if you are a quadratic guru, start there. And (if there are parts) don’t let Part A panic you. Start with Part B if you like!
- Do the easy bits of each question first. If you get to a hard part of a question, then stop, and come back to it. Don’t waste lots of time getting nowhere.
- Come back to the hard bits near the end if you have time.
- Having said this, try to get something done for each question if you possibly can: you may get part marks.
- Show all working! Part marks are given for each correct and relevant thing you do.
- Don’t cross out your answer and replace it with nothing. You are better with a rubbish answer than no answer at all (if you have already written it down. That is, if you do something, then deduce it’s wrong but don’t have time or knowledge to go back and redo it, leave what you have).
- If you know you are wrong, say so, and say how you know. You’ll get back up to half of the marks you lost if you give a logical reason for how you know your answer is wrong.
- Don’t panic if many are leaving early. They might not be able to do some questions. Don’t panic if you want to leave and no-one else is. Maybe you’re smarter than they are?
- Check any answers you can, given time.
16.2 Midsemester exam, 2006

Part A, Midsemester exam, 2006

For each of the following 26 questions, find the correct value of \( x \). There is no need to show any working. Each correct answer is worth 1 mark; each incorrect answer is worth 0 marks. (Hint: in each case, \( x \) is an integer between \(-6\) and \(6\) inclusive.)

1. \( x \) is the highest common factor of 12 and 21. 2. \( x \in \{2, 3, 4, 5, 6\} \), \( x \) and 12 are relatively prime.

3. \( x = t - \sqrt{\frac{t}{2}} \), where \( t = 8 \)

4. \( \frac{1}{2} + \frac{1}{4} = \frac{x}{8} \)

5. \( x = | -5^0 | \)

6. \( \frac{1}{x + 2} = \frac{2}{8} \)

7. \( 3|x| = | -x | \)

8. \( x = -a^2 - a, \text{ where } a = -1 \)

9. \( 4\pi - x\pi = 6\pi \)

10. \( y = 4x + 1, \text{ where } y = -11 \)

11. \( -4 + x = 3x \)

12. \( \sqrt{-10x} = \sqrt{10} \)

13. \( x + 2 = 6 - x \)

14. \( (\{0, 1, 2, 4\} \cap \{1, 4, -1\}) \setminus \{1, 2, x\} = \emptyset \)

15. \( (2\sqrt{5})^2 \div x = 5 \)

16. \( (\sqrt{-x})^2 = 6 \)

17. \( x^6 = -x^4 \)

18. \( 2^{-x} = 8 \)

19. \( 16^{1/x} = 4 \)

20. \( x \times (-1)^x = 3 \)

21. \( 3^4 = 3^{n+x} \times 3^{1-n} \)

22. \( \sum_{i=1}^{4} 2i = x + 14 \)

23. \( \sum_{i=0}^{n} (i^2 - ix) = -5 \)

24. \( \sum_{i=0}^{4} x = -6 \)

25. \( (4t - 4) = x(1 - t) \quad (t \neq 1) \)

26. The probability of any event is a number between 0 and \( x \)

For each of the following 9 multichoice questions, find the correct answer. There is no need to show any working. Each correct answer is worth 1 mark; each incorrect answer is worth 0 marks.

1. The intervals \([-2, 2]\) and \((0, 3)\) overlap on the interval:
   - (a) \([-2, 3]\)  
   - (b) \([-2, 3]\)  
   - (c) \((0, 2]\)  
   - (d) \((0, 2]\)  
   - (e) \([0, 2]\)  
   - (f) \((-2, 3)\)

2. The inequality \( x \geq 4 \text{ or } x < -2 \) can be written in interval form as:
   - (a) \([4, \infty)\)  
   - (b) \([-2, 4]\)  
   - (c) \((-2, -\infty)[4, \infty)\)  
   - (d) \((-\infty, -2]\[4, \infty)\)  
   - (e) \((-\infty, -2]\[4, \infty)\)  
   - (f) \((-\infty, 4]\)

3. A coin is tossed 6 times. What is the probability of 6 heads in a row?
   - (a) \(\frac{5}{6}\)  
   - (b) \(\frac{1}{8}\)  
   - (c) \(\frac{1}{6}\)  
   - (d) \(\frac{1}{32}\)  
   - (e) \(\frac{3}{32}\)  
   - (f) \(\frac{1}{64}\)

4. Which one of the following statements is false?
   - (a) \(\frac{1}{a} \times \frac{1}{b} = \frac{1}{a \times b}\)  
   - (b) \(\frac{1}{a} - \frac{1}{b} = b - a \div ab\)  
   - (c) \(\left(\frac{1}{a}\right) \div \left(\frac{1}{b}\right) = \frac{b}{a}\)  
   - (d) \(\left(\frac{1}{a}\right) \div \left(\frac{1}{b}\right) = (ab)^{-1}\)  
   - (e) \(\frac{1}{a} + \frac{1}{b} = \frac{a + b}{ab}\)  
   - (f) \(\left(\frac{1}{a}\right) \div \left(\frac{1}{b}\right) = a^{-1}b\)

5. Which one of the following statements is true?
   - (a) \(3 \in \mathbb{Z} \text{ but } 3 \notin \mathbb{N}\)  
   - (b) \(-3 \in \mathbb{Z} \text{ but } -3 \notin \mathbb{N}\)  
   - (c) \(-3 \in \mathbb{N} \text{ but } -3 \notin \mathbb{Z}\)  
   - (d) \(3 \in \mathbb{N} \text{ but } 3 \notin \mathbb{Z}\)  
   - (e) \(-3 \in \mathbb{Z} \text{ and } -3 \notin \mathbb{N}\)  
   - (f) None of statements (a), (b), (c), (d) or (e) is true.
6. The equation of the line passing through the points \((0, \pi^2)\) and \((\pi^2, \pi^2)\) is:
   (a) \(x = \pi\).  \(b) x = \pi^2.\)  (c) \(y = x \times \pi^2.\)  (d) \(y = \pi.\)  (e) \(y = \pi^2.\)  (f) \(y = \pi^2x.\)

7. Let \(A\) and \(B\) be sets. Which one of the following statements must be true?
   (a) \(A \cup B \subseteq A.\)  \(b) A \cup B \subseteq A \cap B.\)  (c) \(A \cap B \subseteq A \cup B.\)  (d) \(A \cap B \subseteq A \setminus B.\)  (e) \((A \cup \emptyset) \cup (B \cup \emptyset) \subseteq A.\)  (f) None of those statements must be true.

8. Which of the following statements is false?
   (a) 9 and 16 are relatively prime.
   (b) 7 and 13 are both prime.
   (c) The highest common factor of 20 and 10 is 10.
   (d) Any two relatively prime numbers must both be prime.
   (e) Any two prime numbers must be relatively prime.
   (f) None of statements (a), (b), (c), (d) or (e) is false.

9. Which of the following statements is false?
   (a) \((2\sqrt{2x})^2 = 8x.\)  (b) \(\sqrt{x} + \sqrt{x} + \sqrt{x} = \sqrt{9x}.\)
   (c) \(\sqrt{a} + \sqrt{b} + \sqrt{c} = \sqrt{a+b+c}.\)  (d) \(\frac{1}{\sqrt{a}} + \sqrt{\frac{a}{b}} = \frac{2}{\sqrt{a}}.\)
   (e) None of statements (a), (b), (c), (d) or (e) is false.

The following five expressions have their Venn diagrams drawn below, in random order, with five extra (un-used) diagrams included. Match each expressions with the corresponding shaded region, by writing the letter of the corresponding diagram next to each expression. Note that the diagrams are labelled D to M. Diagram L represents the empty set.

(5 marks) (1) \(A \cup B.\)  (2) \(C \setminus \emptyset.\)  (3) \(A \cap B \cap C.\)  (4) \(A \setminus (B \cap C).\)  (5) \(A \setminus (A \cup B).\)

Part B, Midsemester exam, 2006

Each of the following questions carries the stated number of marks. Write your answers in the space provided. Part marks will be awarded for correct working.

1. Evaluate \(\frac{1}{3} \times \frac{1}{2} + \frac{1}{5} \div \left(\frac{1}{2}\right)^2,\) leaving the answer as a fraction. Show all working. \(3\) marks

2. (a) Find all \(x\) for which \(-2x + 4 \geq x + 1,\) writing your answer in inequality form. (An example of inequality form is \(x > \ldots\).) \(3\) marks
   (b) Write your answer to part (a) in interval format. \(1\) mark
   (c) Mark your answer to part (a) on the real line. \(1\) mark
3. Write in summation (sigma) notation:

\[ 11x + 10x + 9x + 8x + 7x + 6x + 5x + 4x + 3x + 2x + x \]  
(2 marks)

4. Write in summation (sigma) notation:

\[ (4x + 4) + (6x + 9) + (8x + 16) + (10x + 25) + (12x + 36) \]  
(3 marks)

5. Find the equation of the line passing through the points \((1, -2\sqrt{5})\) and \((2, -\sqrt{5})\).  
(4 marks)

6. Solve for \(x\):

\[ \frac{1}{4x + 4} = \frac{1}{5x + 6} \]  
(2 marks)

7. Show that:

\[ \frac{1}{\sqrt{2}} \left( \frac{\sqrt{18}}{3} + \frac{\sqrt{8}}{3} \right) = \left( \frac{3^2 + 4^2}{2^3 + 1^3} \right)^{\frac{1}{2}} \]  
(4 marks)

8. Solve \( |x - 2| = 4 \).  
(2 marks)

9. Let \( L \) be the line \( y = x + 4 \), and let \( M \) be the line perpendicular to \( L \) passing through the point \((-1, 3)\). Find the distance between the \( y \)-intercept of \( L \) and the \( x \)-intercept of \( M \). Express your answer as a surd in simplest form.  
(6 marks)

10. Simplify \( -(xy^2) \div (x^{-1}y^{-2}) \times (x^{1/2}y^2)^{-2} \).  
(3 marks)

11. Find \( x \) if \( (5x + 5)(2x + 1) = 10x^2 + x + 5 \).  
(3 marks)

12. Let \( x \) and \( y \) be two random numbers between 1 and 10 inclusive, where selection is independent. In each case find the probability that:

(a) \( x = 10 \).  
(1 mark)

(b) \( x = 10 \) and \( y = 10 \).  
(1 mark)

(c) \( x = 10 \) or \( y = 10 \).  
(1 mark)

(d) \( x = y \).  
(1 mark)

(e) \( x < y \).  
(1 mark)

(f) \( x = 10 \) given that \( y = 10 \).  
(1 mark)

(g) \( x + y < 13 \) given that \( y = 10 \).  
(1 mark)

13. It can be shown that for any \( n \geq 0 \), \( \sum_{i=1}^{n} \frac{1}{2^i} = 1 - 2^{-n} \).

(a) Show this is true for \( n = 2 \) and \( n = 3 \).  
(3 marks)

(b) Find \( 1 - \sum_{i=1}^{100} \frac{1}{2^i} \).  
(3 marks)
16.3 Solutions to midsemester exam, 2006

In some cases we use the shorthand notation LHS to mean the left-hand side of the given expression, and RHS to mean the right-hand side.

Part A, Midsemester exam, 2006

Single number answer: In each case we give the value for $x$. After the answers we show the working for some of the harder questions.

1. 3  2. 5  3. 6  4. 6  5. 1  6. 2  7. 0  8. 0  9. −2  10. −3
11. −2  12. −1  13. 2  14. 4  15. 4  16. −6  17. 0  18. −3  19. 2  20. −3
21. 3  22. 6  23. 6  24. −2  25. −4  26. 1

Working:

3. Substitute 8 in for $t$ in the expression. So $\sqrt{t/2} = \sqrt{8/2} = \sqrt{4} = 2$, and $x = 8 - 2 = 6$.

7. $|−x| = |x|$. Hence we have $3 | x | = | x |$, so $x = 0$.

8. BEDMAS says that we do the squaring before we make $a$ negative. Then substitute $-1$ in for $a$ in the expression. So $-a^2 + a = -(-1)^2 - (-1) = -1 + 1 = 0$.

16. We cannot take the square root of a negative number, so $-x$ must be positive, so $x$ must be negative. If we take the square root of both sides we get $\sqrt{-x} = \sqrt{6}$. Hence $x = -6$.

20. $-1^x$ either equals 1 (if $x$ is even), or $-1$ (if $x$ is odd). Hence we have $x \times 1 = 3$ (if $x$ is even), or $x \times -1 = 3$ (if $x$ is odd). Clearly, $x$ must be 3 or $-3$. In either case, $x$ is odd, so we must have $x \times -1 = 3$, so $x = -3$.

21. $3^4 = 3^{n+x} \times 3^{1-n} = 3^{n+x+1-n} = 3^{x+1}$. Hence $x = 3$.

Multichoice.

1. Answer is (c).
2. Answer is (e).
3. The probability of tossing 6 heads in a row is $\frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} = \frac{1}{2^6} = \frac{1}{64}$. Hence the answer is (f).
4. Answer is (d). All other statements are true, but look at this one. LHS is $\frac{1}{a} \div \frac{1}{b} = \frac{1}{a} \times b = \frac{b}{a}$, whereas RHS is $(ab)^{-1} = \frac{1}{ab}$.
5. Answer is (b). −3 is an integer, but it is not a natural number.

6. In each case, the $y$-coordinate is the same, so the line is horizontal, with equation $y = \pi^2$. Hence answer is (e).

7. Answer is (c). Simple examples show that none of the others has to be true. For example, try the sets $A = \{1\}$ and $B = \{2\}$.

8. Answer is (d). For example, 9 and 10 are relatively prime but neither is prime.

9. Answer is (d). You can check that the others are all true using simple calculations.

Matching diagrams with expressions. In each case we give the letter of the corresponding diagram.

(1) F  (2) M  (3) E  (4) I  (5) L
Part B, Midsemester exam, 2006

1. \[ \frac{1}{3} \times \frac{1}{2} + \frac{1}{5} \div \left( \frac{1}{2} \right)^2 = \frac{1}{3} \times \frac{1}{2} + \frac{1}{5} \div \frac{1}{4} = \frac{1}{6} + \frac{1}{5} \times 4 = \frac{1}{6} + \frac{4}{5} = \frac{5}{30} + \frac{24}{30} = \frac{29}{30}. \]

2. (a) \(-2x + 4 \geq x + 1\), so \(-3x \geq -3\), so \(x \leq 1\).  
(b) \((\infty, 1]\).  
(c) 

3. \[ \sum_{i=1}^{11} ix. \] (Any correct expression is ok.)

4. \[ \sum_{i=2}^{6} (2ix + i^2). \] (Any correct expression is ok.)

5. Let \((x_1, y_1) = (1, -2\sqrt{3})\) and \((x_2, y_2) = (2, -\sqrt{3})\), so \(m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{-\sqrt{3} - (-2\sqrt{3})}{2 - 1} = \frac{\sqrt{3}}{1} = \sqrt{3}. \) Hence \(y = mx + c\) so \(y = \sqrt{3}x + c\), and \((1, -2\sqrt{3})\) is on the line, so \(-2\sqrt{3} = \sqrt{3} \times 1 + c\), so \(-2\sqrt{3} - \sqrt{3} = c\), so \(c = -3\sqrt{3}\) and hence the equation of the line is \(y = \sqrt{3}x - 3\sqrt{3}\).

6. \[ \frac{1}{4x + 4} = \frac{1}{5x + 6} \] so \(4x + 4 = 5x + 6 \) so \(4x - 5x = 6 - 4\), so \(-x = 2\), so \(x = -2\).

7. \[ \text{LHS} = \frac{1}{\sqrt{2}} \left( \frac{3\sqrt{3}}{3} + \frac{2\sqrt{3}}{3} \right) = \frac{1}{\sqrt{2}} \left( \frac{5\sqrt{3}}{3} \right) = \frac{5\sqrt{3}}{3\sqrt{2}} = \frac{5}{3}. \] \[ \text{RHS} = \left( \frac{9 + 16}{8 + 1} \right)^{1/2} = \left( \frac{25}{9} \right)^{1/2} = \frac{5}{3}. \]

8. \(|-x + 2| = 4 \) so \(-x + 2 = 4\) or \(-x + 2 = -4\). Hence \(-x = 2\) or \(-x = -6\), so \(x = -2\) or \(x = 6\).

9. The line \(L\) has gradient 1, so the line \(M\) (which is perpendicular to \(L\)) has gradient \(-1\). \(M\) passes through the point \((-1, 3)\) and so we get \(y = -1x + c\), so \(3 = -1 \times -1 + c\), so \(3 = 1 + c\), so \(c = 2\). Hence \(M\) is the line \(y = -x + 2\).

   From the equation for \(L\), its \(y\)-intercept is \((0, 4)\). The \(x\)-intercept of \(M\) is where the \(y\)-coordinate is 0, so \(0 = -x + 2\), so \(x = 2\). Hence the \(x\)-intercept is \((2, 0)\).

   We want to find the distance between \((x_1, y_1) = (0, 4)\) and \((x_2, y_2) = (2, 0)\). So \(d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2} = \sqrt{(2 - 0)^2 + (0 - 4)^2} = \sqrt{4 + 16} = \sqrt{20} = 2\sqrt{5}\).

10. \((-xy^2) \div (x-1y^2) \times (x^{1/2}y^2)^{-2} = -xy^2 \times (x^1y^2) \times (x^{-1}y^{-4}) = -x^{(1+1-1)}y^{(2+2-4)} = -x^1y^0 = -x. \)

11. \((5x + 5)(2x + 1) = 10x^2 + x + 5\), so \(10x^2 + 5x + 10x + 5 = 10x^2 + x + 5\), so \(15x + 5 = x + 5\), so \(15x = x\), so \(14x = 0\), so \(x = 0\).

12. There are 100 different possible outcomes, for example \(x = 1, y = 1\) is one outcome, as is \(x = 1, y = 2\) etc.

   (a) \(x = 10\) happens in 10 cases: \(\text{Prob}(x = 10) = \frac{10}{100} = \frac{1}{10}\).

   (b) \(x = 10\) and \(y = 10\) happens in only one case: \(\text{Prob}(x = 10, y = 10) = \frac{1}{100}\).

   (c) From the Principle of Inclusion/exclusion we know that \(\text{Prob}(x = 10\ or\ y = 10) = \text{Prob}(x = 10) + \text{Prob}(y = 10) - \text{Prob}(x = 10\ and\ y = 10). \)

   Hence from parts (a) and (b) we have \(\text{Prob}(x = 10\ or\ y = 10) = \frac{10}{100} + \frac{10}{100} - \frac{1}{100} = \frac{19}{100}. \)

   (d) \(x = y\) happens in 10 cases: \(\text{Prob}(x = y) = \frac{10}{100} = \frac{1}{10}. \)

   (e) We know that \(\text{Prob}(x = y) = \frac{10}{100}\). Hence \(\text{Prob}(x \neq y) = \frac{90}{100}\). Hence by symmetry \(\text{Prob}(x < y)\) must be half this, so \(\text{Prob}(x < y) = \frac{90}{100} = \frac{9}{20}. \)
(f) As selection is independent, we know that \( y = 10 \) has no influence on what \( x \) will be. Hence \( \text{Prob}(x = 10 \text{ given } y = 10) = \frac{1}{10} \).  

(g) We are given that \( y = 10 \). Hence for \( x + y < 13 \), we need \( x < 3 \). \( \text{Prob}(x < 3) = \frac{2}{10} = \frac{1}{5} \).

13. (a) When \( n = 2 \), on the LHS we get \( \frac{1}{2^1} + \frac{1}{2^2} = \frac{2}{4} + \frac{1}{4} = \frac{3}{4} \). On the RHS we get \( 1 - 2^{-2} = 1 - \frac{1}{2^2} = 1 - \frac{1}{4} = \frac{3}{4} \). So LHS=RHS, so it is true for \( n = 2 \).

When \( n = 3 \), on the LHS we get \( \frac{1}{2^1} + \frac{1}{2^2} + \frac{1}{2^3} = \frac{4}{8} + \frac{2}{8} + \frac{1}{8} = \frac{7}{8} \). On the RHS we get \( 1 - 2^{-3} = 1 - \frac{1}{2^3} = 1 - \frac{1}{8} = \frac{7}{8} \). So LHS=RHS, so it is true for \( n = 3 \).

(b) To find \( 1 - \sum_{i=1}^{100} \frac{1}{2^i} \), first let’s find \( \sum_{i=1}^{100} \frac{1}{2^i} \). Substitute \( n = 100 \) into the RHS of the equation, giving \( \sum_{i=1}^{100} \frac{1}{2^i} = 1 - 2^{-100} = 1 - \frac{1}{2^{100}} \). Hence \( 1 - \sum_{i=1}^{100} \frac{1}{2^i} = 1 - (1 - \frac{1}{2^{100}}) = \frac{1}{2^{100}} \).
16.4 Midsemester exam, 2005

Part A, Midsemester exam, 2005

For each of the following 32 questions, find the correct value of \( x \). There is no need to show any working. Each correct answer is worth 1 mark; each incorrect answer is worth 0 marks. (Hint: in each case, \( x \) is an integer between \(-6\) and \(6\) inclusive.)

1. removed (not relevant)
2. removed (not relevant)
3. \( x = -6 \)
4. \( 2^{-x} = 4 \)
5. \( x = f(-1) \) where \( f(a) = (-a)^2 - a \)
6. \( x = f(-1) \) where \( f(a) = -a^2 - a \)
7. \( x = f(8) \) where \( f(t) = t - \sqrt{t} \)
8. \( \frac{x}{3} - \frac{2}{3} = \frac{2x}{3} \)
9. \( \pi^x \div \pi^{-2} = \frac{1}{\pi^4} \)
10. \( \frac{1}{x} + 1 = 0 \)
11. \( \sum_{i=x}^{3} i = 0 \)
12. \( x \) is the highest common factor of 7 and 15
13. \( x = \sum_{i=0}^{2} i^2 \)
14. \( \sum_{i=x-1}^{x} i = -5 \)
15. \( 8^{2/x} = 4 \)
16. \( \sqrt{24} = -x\sqrt{6} \)
17. \( \sqrt{8x} = 4\sqrt{3} \)
18. \( 2^x \div 2^{-x} = 2^{-8} \)
19. \( y = 3x - 7 \) where \( y = 2 \)
20. \( 4^{x+1} = \frac{1}{8} \)
21. \( f(t) = \sqrt{t} + 4 \) has range \([x, \infty)\)
22. \( f(t) = \sqrt{3t} + x \) has range \([-3, \infty)\)
23. \( f(y) = \frac{1}{y} \) has domain \((-\infty, \infty) \setminus \{x\} \)
24. \( f(t) = \sqrt{t} + x \) has domain \([-3, \infty)\)
25. \( 3^{-x} = 3^{n+1} \times 3^{1-n} \)
26. \( 2|x| = |x - x| \)
27. \( x \times -1^x = 5 \)
28. \( \frac{1}{x} = 1 - x \)
29. \( (t - 1) = x(1 - t) \) \((t \neq 1)\)
30. \( x \) is gradient of a line parallel to \( y(t) = \frac{t}{3} + 2 \)
31. \( x \) is gradient of a line perpendicular to \( y(t) = \frac{t}{3} + 2 \)
32. \( x \) is the \(y\)-intercept on the graph of \( y(t) = 3t^2 - 4t \)

For each of the following 6 multichoice questions, find the correct answer. There is no need to show any working. Each correct answer is worth 1 mark; each incorrect answer is worth 0 marks.

1. Let \( f(x) = -2 \mid x \mid \). What is the range of \( f(x) \)?
   \( (a) [0, \infty) \)  \( (b) [2, \infty) \)  \( (c) (-\infty, 0) \cup (0, \infty) \)  \( (d) (-\infty, -2] \)  \( (e) (-\infty, 0] \)  \( (f) (\infty, \infty) \)

2. Let \( f(x) = \frac{1}{\sqrt{x-1}} \). What is the domain of \( f(x) \)?
   \( (a) (-\infty, 0) \cup (0, \infty) \)  \( (b) [1, \infty) \)  \( (c) (-\infty, \infty) \)  \( (d) [-1, \infty) \)  \( (e) [0, \infty) \)  \( (f) (1, \infty) \)

3. Which one of the following statements is false?
   \( (a) \frac{2}{a} \times \frac{1}{2b} = \frac{1}{a \times b} \)  \( (b) \frac{1}{a} - \frac{1}{b} = \frac{b - a}{ab} \)  \( (c) \left( \frac{1}{a} \right) \div \left( \frac{1}{b} \right) = \frac{b}{a} \)
   \( (d) \left( \frac{1}{a} \right) \div \left( \frac{1}{b} \right) = a^{-1}b \)  \( (e) \frac{2}{a} + \frac{1}{b} = \frac{2a + b}{ab} \)  \( (f) \left( \frac{1}{a} \right) \div b = \frac{1}{ab} \)
4. Which one of the following statements is true?
   (a) \(Z \subseteq R \subseteq N\).
   (b) \(Z \subseteq N \subseteq R\).
   (c) \(R \subseteq N \subseteq Z\).
   (d) \(R \subseteq Z \subseteq N\).
   (e) \(N \subseteq R \subseteq Z\).
   (f) None of statements (a), (b), (c), (d) or (e) is true.

5. Let \(A\) and \(B\) be sets. Which one of the following statements must be true?
   (a) \(A \setminus B \subseteq B\).
   (b) \(B \subseteq A \setminus B\).
   (c) \(A \cup \emptyset \subseteq A \cap \emptyset\).
   (d) \(A \setminus B = (A \cup B) \setminus B\).
   (e) \(A = A \setminus (B \cup \emptyset)\).
   (f) None of statements (a), (b), (c), (d) or (e) must be true.

6. Which one of the following statements is false?
   (a) Any two distinct even numbers are not relatively prime.
   (b) Any two prime numbers must be relatively prime.
   (c) Every prime number greater than 2 is odd.
   (d) If \(n\) is a positive integer then the highest common factor of \(n\) and \(n^3\) is \(n\).
   (e) If \(n\) is an even integer then \(n\) cannot be written as the product of prime factors.
   (f) None of statements (a), (b), (c), (d) or (e) is false.

The following seven equations have their graphs drawn below, in random order, with eight extra graphs included. Match each equation with its graph, by writing the letter of the corresponding graph next to each equation. Note that the graphs are labelled A to O.

(7 marks)

(1) \(y = |−x|\).
(2) \(y = −x^2 + 4\).
(3) \(y = \sqrt{31}\).
(4) \(x + (1.7)^4 = −0.05\).
(5) \(y − 2x − 4 = 0\).
(6) \(4(y − 1) = −2(x + 2)\).
(7) \(\frac{y}{2} = \frac{x}{2} + \frac{5}{11}\).

Graph A  Graph B  Graph C  Graph D  Graph E  Graph F  Graph G  Graph H
Graph I  Graph J  Graph K  Graph L  Graph M  Graph N  Graph O

Part B, Midsemester exam, 2005

Each of the following questions carries the stated number of marks. Write your answers in the space provided. Part marks will be awarded for correct working.

1. Evaluate \(\frac{1}{4} + \frac{1}{2} \div \left(\frac{1}{2}\right)^2 \times \frac{1}{3}\), leaving the answer as a fraction. Show all working. (3 marks)

2. Solve for \(x\): \((x − \sqrt{2})(x + \sqrt{2}) = 2(x^2 - 1)\). (2 marks)

3. (a) Find all \(x\) for which \(-3x + 2 \leq −x − 4\), writing your answer in inequality form. (An example of inequality form is \(x > \ldots\)). (3 marks)
   (b) Write your answer to part (a) in interval format. (1 mark)
   (c) Mark your answer to part (a) on the real line. (1 mark)
4. Solve $|−2x + 3| = 7$. (2 marks)

5. (a) Write in summation (sigma) notation:

$$(2x - 4)^2 + (3x - 6)^2 + (4x - 8)^2 + (5x - 10)^2 + (6x - 12)^2$$

(b) Write in summation (sigma) notation:

$$10x + 9x + 8x + 7x + 6x + 5x + 4x + 3x + 2x$$

(2 marks)

6. Let $A = \{-1, 0, 1\}$, $B = \{0, 1, 2\}$ and $C = \{0, 3, 6\}$.

(a) Mark the sets $A$, $B$ and $C$ on a Venn diagram, with the elements of each set written on the diagram. (2 marks)

(b) Write down the set $A \setminus (B \cup C)$. (1 mark)

(c) Write down the set $(A \cap B) \setminus (A \cap C)$. (1 mark)

(d) Write down the set $((C \setminus B) \setminus A) \setminus C$. (1 mark)

(e) Write down the set $(C \cup \emptyset) \setminus (A \cup \emptyset) \setminus (B \cup \emptyset)$. (1 mark)

7. If $f(x) = x^2 + 1$, evaluate and simplify $\frac{f(x + h) - f(x)}{h}$. (4 marks)

8. Find the distance between the points $(\sqrt{3}, \sqrt{2})$ and $(-\sqrt{3}, -\sqrt{2})$, expressing your answer in simplest form. (3 marks)

9. Find the equation of the line passing through the points $(0, \sqrt{5})$ and $(2, -3\sqrt{5})$. (4 marks)

10. Solve the following system of two simultaneous equations:

$$6x - 3y = 3$$
$$-2x + 5y = -1.$$ (4 marks)

11. Solve the following system of two simultaneous equations:

$$4x + 2y = 6$$
$$-6x - 3y = 9.$$ (3 marks)

12. Let $S$ be a set containing $n$ values, so $S = \{x_1, x_2, \ldots, x_n\}$. We define two values $y$ and $z$ by:

$$y = \frac{\sum_{i=1}^{n} x_i}{n} \quad \text{and} \quad z = \sum_{i=1}^{n} \frac{(x_i - y)^2}{x_i}.$$ 

Evaluate $z$ when $n = 4$ and $S = \{2, 6, 3, 5\}$, leaving your answer as a fraction. Show working. (5 marks)
16.5 Solutions to midsemester exam, 2005

In some cases we use the shorthand notation LHS to mean the left-hand side of the given expression, and RHS to mean the right-hand side.

Part A, Midsemester exam, 2005

**Single number answer:** In each case we give the value for \( x \). After the answers we show the working for some of the harder questions.

1. \(-1\)  
2. \(4\)  
3. \(-6\)  
4. \(-2\)  
5. \(2\)  
6. \(0\)  
7. \(6\)  
8. \(-2\)  
9. \(-6\)  
10. \(-1\)  
11. \(-3\)  
12. \(1\)  
13. \(5\)  
14. \(-2\)  
15. \(3\)  
16. \(-2\)  
17. \(6\)  
18. \(-4\)  
19. \(3\)  
20. \(-4\)  
21. \(4\)  
22. \(-3\)  
23. \(0\)  
24. \(3\)  
25. \(-2\)  
26. \(0\)  
27. \(-5\)  
28. \(1\)  
29. \(-1\)  
30. \(-2\)  
31. \(-3\)  
32. \(0\)

**Working:**

4. Note that \( 4 = 2^2 \), so we have \( 2^{-x} = 2^2 \), so \( x = -2 \).

5. Substitute \(-1\) in for \( a \) in the expression. So \(( -1)^2 + 1 = 1 + 1 = 2 \).

6. BEDMAS says that we do the squaring **before** we make \( a \) negative. Then substitute \(-1\) in for \( a \) in the expression. So \(-a^2 + a = -(1^2) - (-1) = -1 + 1 = 0 \).

7. Substitute \( 8 \) in for \( t \) in the expression. So \( \sqrt{t^2} = \sqrt{8^2} = \sqrt{4} = 2 \), and \( x = f(8) = 8 - 2 = 6 \).

8. The denominators are all \( 3 \), so multiplying each side by \( 3 \) gives \( x - 2 = 2x \), so \( x = -2 \).

9. We have \( \pi^2 / \pi^{-2} = \pi^4 \), so \( \pi^{x+2} = \pi^{-4} \), so \( x + 2 = -4 \), so \( x = -6 \).

10. \( 1/x = -1 \), so multiplying each side by \( x \) we get \( x = -1 \).

11. We are summing the values of \( i \) as \( i \) goes from \((x) - 1 \) to \( x \). Hence \((x) - 1 + x = -5 \), so \( 2x - 1 = -5 \), so \( 2x = -4 \) so \( x = -2 \).

12. \( 8^{2/x} = 4 \) so \( (2^3)^{2/x} = 2^2 \) so looking at the powers, \( 3 \times (2/x) = 2 \) so \( 6/x = 2 \), so \( x = 3 \).

13. \( \sqrt{24} = \sqrt{4 \times 6} = 2\sqrt{6} \). Hence \( x = -2 \).

14. \( 4\sqrt{3} = \sqrt{16 \times 3} = \sqrt{48} \). Hence \( 8x = 48 \) so \( x = 6 \).

15. \( 2x / 2^{-x} = 2^{x+x} = 2^{2x} \). Hence \( 2x = -8 \) so \( x = -4 \).

16. \( 2 = 3x - 7 \), so \( 3x = 9 \) so \( x = 3 \).

17. Note that \( \frac{4^{x+1}}{2^{x+1}} = \left( \frac{4}{2} \right)^{x+1} = 2^{x+1} \). Also, \( 1/8 = 2^{-3} \). Hence \( 2^{x+1} = 2^{-3} \), so \( x + 1 = -3 \), so \( x = -4 \).

18. Note that \( \sqrt{7} \) has range \([0, \infty)\), so when we add 4 to this, the range must be \([4, \infty)\), so \( x = 4 \).

19. Note that \( \sqrt{3t} \) has range \([0, \infty)\), so to have range \([-3, \infty)\) we must subtract 3 from this, so \( x = -3 \).

20. This function exists at every input value except we cannot divide by 0. Hence the domain of \( f \) is everything except the point 0, so \( x = 0 \).

21. This function only exists when we are taking the square root of a positive number or 0. For the domain to be \([-3, \infty)\), we must have the situation that when \( x \) is added to each number in the domain, we get a positive number or 0. Hence \( x = 3 \).

22. \( 3^{n+1} \times 3^{1-n} = 3^{n+1+1-n} = 3^2 \). Hence \( x = -2 \).
26. \( |-x| = |x| \). Hence we have \( 2 \mid x \mid x \mid \), so \( x = 0 \).

27. \(-1^x\) either equals 1 (if \( x \) is even), or \(-1 \) (if \( x \) is odd). Hence we have \( x \times 1 = 5 \) (if \( x \) is even), or \( x \times -1 = 5 \) (if \( x \) is odd). Clearly, \( x \) must be 5 or \(-5\). In either case, \( x \) is odd, so we must have \( x \times -1 = 5 \), so \( x = -5 \).

28. We have \( x^{-1} = 1^{-x} \), and trial and error gives \( x = 1 \).

29. The domain represents every point at which it is possible to evaluate the function. This function does not work when \( x - 1 < 0 \) (as then we would have \( \sqrt{ } \) of a negative number), or when \( \sqrt{x - 1} = 0 \) (as then we would be dividing by 0). Hence domain is everything else, which is \( 1 \) to \( \infty \), but not including 1. Hence answer is (f).

30. The gradient represents every point at which it is possible to evaluate the function. This function does not work when \( x - 1 < 0 \) (as then we would have \( \sqrt{ } \) of a negative number), or when \( \sqrt{x - 1} = 0 \) (as then we would be dividing by 0). Hence domain is everything else, which is \( 1 \) to \( \infty \), but not including 1. Hence answer is (f).

31. The answer is (e). All other statements are true, but look at this one. LHS is \( \frac{2}{a} + \frac{1}{b} = \frac{2b}{ab} + \frac{a}{ab} = \frac{2b + a}{ab} \), which does not equal the RHS.

32. Answer is (f); this is easy.

33. Answer is (d). Simple examples show that none of (a), (b), (c) or (e) has to be true. For example, try the sets \( A = \{1, 3\} \) and \( B = \{1, 2\} \). However, from a Venn diagram you can see that (d) is true.

34. Answer is (e). Can’t be (a): any two distinct even numbers have a common factor of 2, so cannot be relatively prime. Then (b) is clearly true, as is (c) and (d). However, (e) is false, as every number can be written as the product of prime factors.

Matching graphs with equations. In each case we give the letter of the corresponding graph.

Part B, Midsemester exam, 2005

1. \( \frac{1}{4} + \frac{1}{2} \div \left( \frac{1}{2} \right)^2 \times \frac{1}{3} = \frac{1}{4} + \frac{1}{2} \times \frac{2}{3} = \frac{1}{4} + \frac{1}{3} = \frac{1}{4} + \frac{1}{3} = \frac{1}{4} + \frac{4}{12} = \frac{3}{12} + \frac{8}{12} = \frac{11}{12} \).

2. \( (x - \sqrt{2})(x + \sqrt{2}) = 2(x^2 - 1) \), so \( x^2 - x\sqrt{2} + x\sqrt{2} - \sqrt{2} \times \sqrt{2} = 2x^2 - 2 \), so \( x^2 - 2 = 2x^2 - 2 \), so \( x^2 = 2x^2 \), so \( x^2 = 0 \), so \( x = 0 \).

3. (a) \(-3x + 2 \leq -x - 4 \), so \(-2x \leq -6 \), so \(-x \leq -3 \), so \( x \geq 3 \). (b) \([3, \infty)\). (c)

4. \(|-2x + 3| = 7 \) so \(-2x + 3 = 7 \) or \(-2x + 3 = -7 \). Hence \(-2x = 4 \) or \(-2x = -10 \) so \( x = -2 \) or \( x = 5 \).

5. (a) \( \sum_{i=2}^{6} (ix - 2i)^2 \). (Any correct expression is ok.) (b) \( \sum_{i=2}^{10} ix \). (Any correct expression is ok.)
6. (a) \[
\begin{array}{c}
\text{A} \\
-1 \\
1 \\
2 \\
\text{B} \\
-1 \\
2 \\
3 \\
6 \\
\text{C} \\
0 \\
\end{array}
\]

(b) \(-1, 0, 1 \setminus (\{0, 1, 2\} \cup \{0, 3, 6\}) = \{-1, 0, 1\} \setminus \{0, 1, 2, 3, 6\} = \{-1\}.\]

(c) From the diagram, equals \(\{0, 1\} \setminus \{0\} = \{1\}.\]

(d) Look at the expression. The answer is those elements that are in \(C\), but not \(B\), then not \(A\), then not \(C\). Ignoring the middle part of this, we have those elements in \(C\) but not \(C\). Hence the answer must be the emptyset, \(\emptyset\).

(e) We have \(C \cup \emptyset = C, A \cup \emptyset = A\) and \(B \cup \emptyset = B\), so the answer is \(C \cap A \cap B = \{0\}\).

7. We have \(f(x) = x^2 + 1\), so \(f(x+h) = (x+h)^2 + 1 = (x+h)(x+h) + 1 = x^2 + 2xh + h^2 + 1\).
So \(\frac{f(x+h) - f(x)}{h} = \frac{(x^2 + 2xh + h^2 + 1) - (x^2 + 1)}{h} = \frac{x^2 + 2xh + h^2 + 1 - x^2 - 1}{h} = \frac{2xh + h^2}{h} = 2x + h.\]

8. Let \((x_1, y_1) = (\sqrt{3}, \sqrt{2})\) and \((x_2, y_2) = (-\sqrt{3}, -\sqrt{2})\).
Then \(d = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2} = \sqrt{(\sqrt{3} + \sqrt{3})^2 + (\sqrt{2} + \sqrt{2})^2} = \sqrt{(2\sqrt{3})^2 + (2\sqrt{2})^2} = \sqrt{4 \times 3 + 4 \times 2} = \sqrt{12 + 8} = \sqrt{20} = \sqrt{4 \times 5} = 2\sqrt{5}.\]

9. Let \((x_1, y_1) = (0, \sqrt{5})\) and \((x_2, y_2) = (2, -\sqrt{5})\), so \(m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{-\sqrt{5} - \sqrt{5}}{2 - 0} = \frac{-2\sqrt{5}}{2} = -\sqrt{5}.\)
Hence \(y = mx + c\) so \(y = -2\sqrt{5}x + c\), and \((0, \sqrt{5})\) is on the line, so \(\sqrt{5} = -2\sqrt{5} \times 0 + c\), so \(c = \sqrt{5}\) and hence the equation of the line is \(y = -2\sqrt{5}x + \sqrt{5}\).

10. To solve: \[6x - 3y = 3 \quad (1) \quad -2x + 5y = -1 \quad (2)\]
Multiply both sides of (2) by 3, giving \(-6x + 15y = -3\) and then add each side of this to each side of (1), giving \(0x + 12y = 0\), so \(12y = 0\), so \(y = 0\).
Now substitute \(y = 0\) into (1), giving \(6x = 3\), so \(x = 1/2\). Hence the solution is \((x, y) = (1/2, 0)\).
Now we should always check the answer. Substitute \((x, y) = (1/2, 0)\) into Equations (1) and (2), and see that both equations are satisfied, so the answer must be correct.

11. To solve: \[4x + 2y = 6 \quad (1) \quad -6x - 3y = 9 \quad (2)\]
Multiply both sides of (1) by 3, giving \(12x + 6y = 18\), and multiply both sides of (2) by 2, giving \(-12x - 6y = 18\). Add each side of these two equations together, giving \(0x + 0y = 36\), so \(0 = 36\). This is impossible, so there is no solution to these equations.

12. At first glance this question might look a bit intimidating, but there is nothing especially hard about it if you read it. The question says \(n = 4\) so \(S = \{x_1, x_2, x_3, x_4\} = \{2, 6, 3, 5\}\).
Hence \(y = \frac{x_1 + x_2 + x_3 + x_4}{4} = \frac{2 + 6 + 3 + 5}{4} = \frac{16}{4} = 4.\) Then substitute \(y = 4\) into the expression for \(z\), so \(z = \frac{(x_1 - y)^2}{x_1} + \frac{(x_2 - y)^2}{x_2} + \frac{(x_3 - y)^2}{x_3} + \frac{(x_4 - y)^2}{x_4} = \frac{(2 - 4)^2}{2} + \frac{(6 - 4)^2}{6} + \frac{(3 - 4)^2}{3} + \frac{(5 - 4)^2}{5} = \frac{-2^2}{2} + \frac{2^2}{6} + \frac{-1^2}{3} + \frac{1^2}{5} = \frac{4}{2} + \frac{4}{6} + \frac{1}{3} + \frac{1}{5} = 2 + \frac{2}{3} + \frac{1}{5} = 2 + \frac{1}{5} = 3\frac{1}{5}.\)
16.6 Midsemester exam, 2004

Part A, Midsemester exam, 2004

For each of the following 23 questions, find the correct value of \( x \). There is no need to show any working. Each correct answer is worth 1 mark; each incorrect answer is worth 0 marks. (Hint: in each case, \( x \) is an integer between \(-6\) and 6 inclusive.)

1. removed (not relevant) 2. removed (not relevant)
3. \( x = | -3^0 | \) 4. \((\sqrt{-x})^2 = 5\)
5. \( x = f(2) \text{ where } f(a) = (-a)^2 + a. \) 6. \( x = f(2) \text{ where } f(a) = -a^2 + a. \)
7. \( x = f(-1) \text{ where } f(t) = \frac{t^2}{1/2}. \) 8. \( \frac{x}{3} + \frac{2}{3} = 0. \)
9. \( \pi^3 \div \pi^2 = \frac{1}{\pi x}. \) 10. \( x + 1 = \frac{8}{2} \)
11. \( \sum_{i=1}^{x} 2i = 12 \) 12. \( x \) is the highest common factor of 4 and 18
13. \( x = \sum_{i=2}^{2} i \) 14. \( 4^x \div 2^5 = 2^{-1}. \)
15. \( \sqrt{18} = x\sqrt{2} \) 16. \( 2x+1 = 4x^2 \)
17. \( f(t) = \sqrt{t+4} \) has range \([x, \infty)\) 18. \( f(y) = \frac{1}{|y+4|} \) has domain \((-\infty, \infty) \setminus \{x\}\)
19. \( x \times 1^x = -2 \) 20. \(-2 + x = 3x \)
21. \( 3^x = 3^{n+1} \div 3^{n-1} \) 22. \( 4^6 = 4^{-x} \div 4^x \)
23. \( x^4 = -x^{-5} \)

For each of the following 10 multichoice questions, find the correct answer. There is no need to show any working. Each correct answer is worth 1 mark; each incorrect answer is worth 0 marks.

1. What is the value of the gradient (\( m \)) and \( y \)-intercept (\( c \)) of the line \( 3y + 6x = 12. \)
   (a) \( m = 2 \) and \( c = 12. \) (b) \( m = 6 \) and \( c = 12. \) (c) \( m = -2 \) and \( c = 4. \)
   (d) \( m = -2 \) and \( c = -4. \) (e) \( m = 2 \) and \( c = 4. \) (f) \( m = 2 \) and \( c = -4. \)
2. Let \( f(x) = |x| - 1. \) What is the range of \( f(x)? \)
   (a) \( [0, \infty) \) (b) \( (-1, \infty) \) (c) \( (-\infty, 0) \cup (0, \infty) \) (d) \( [-1, \infty) \) (e) \( (-\infty, \infty) \) (f) \( (1, \infty) \)
3. Let \( f(x) = \sqrt{x} \). What is the domain of \( f(x)? \)
   (a) \( (-\infty, -1) \cup (-1, \infty) \) (b) \( [1, \infty) \) (c) \( (-\infty, 0) \cup (0, \infty) \) (d) \( (-\infty, \infty) \) (e) \( [0, \infty) \) (f) \( (0, \infty) \)
4. Which one of the following statements is false?
   (a) \( \frac{1}{a} \times \frac{1}{b} = \frac{1}{a \times b} \) (b) \( \frac{1}{a} - \frac{1}{b} = \frac{b-a}{ab} \) (c) \( \frac{1}{a} \div \frac{1}{b} = \frac{b}{a} \)
   (d) \( \frac{1}{a} \div \frac{1}{b} = (ab)^{-1} \) (e) \( \frac{1}{a} + \frac{1}{b} = \frac{a+b}{ab} \) (f) \( \frac{1}{a} \div \frac{1}{b} = a^{-1}b \)
5. Which one of the following statements is true?
   (a) \( 3 \in \mathbb{Z} \) but \( 3 \not\in \mathbb{N} \) (b) \(-3 \in \mathbb{Z} \) but \(-3 \not\in \mathbb{N} \) (c) \(-3 \in \mathbb{N} \) but \(-3 \not\in \mathbb{Z} \)
   (d) \( 3 \in \mathbb{N} \) but \( 3 \not\in \mathbb{Z} \) (e) \(-3 \in \mathbb{Z} \) and \(-3 \in \mathbb{N} \) (f) None of statements (a), (b), (c), (d) or (e) is true.
6. Let $A$ and $B$ be sets. Which one of the following statements must be true?

(a) $A \subseteq A \cap B$.  
(b) $B \subseteq A \cap B$.  
(c) $A \cup B \subseteq A$.  
(d) $A \cup B \subseteq A \cap B$.  
(e) $A \cup \emptyset \subseteq B$.  
(f) None of statements (a), (b), (c), (d) or (e) must be true.

7. Removed (not relevant).

8. Which one of the following statements is true?

(a) Any two odd numbers are relatively prime.  
(b) If $n$ is a positive integer then the highest common factor of $5n$ and $10n$ is 5.  
(c) There is no even prime number.  
(d) Any two relatively prime numbers must both be prime.  
(e) Any two prime numbers must be relatively prime.  
(f) None of statements (a), (b), (c), (d) or (e) is true.

9. Which one of the following statements is true?

(a) $(\sqrt{4x})^2 = 2x$.  
(b) $2\sqrt{x} + 2\sqrt{x} = \sqrt{4x}$.  
(c) $\sqrt{a} + (\sqrt{b} \times \sqrt{c}) = \sqrt{a\sqrt{b}} + \sqrt{a}\sqrt{c}$.  
(d) $\sqrt{a} - \sqrt{b} = \sqrt{a - b}$.  
(e) $(\sqrt{4x})^2 = 4x$.  
(f) None of statements (a), (b), (c), (d) or (e) is true.

10. The equation of the line passing through the points $(0, \pi^2)$ and $(\pi^2, \pi^2)$ is:

(a) $x = \pi$.  
(b) $x = \pi^2$.  
(c) $y = x \times \pi^2$.  
(d) $y = \pi$.  
(e) $y = \pi^2$.  
(f) $y = \pi^2 \times x$.

The following seven equations have their graphs drawn below, in random order, with eight extra graphs included. Match each equation with its graph, by writing the letter of the corresponding graph next to each equation. Note that the graphs are labelled A to O.

(7 marks)  
(1) $-2(y - x) = 4$.  
(2) $y + 5 = 0$.  
(3) removed (not relevant)  
(4) $x - (1.7)^{27} = 14$.  
(5) $y = |x| \times (-1)^3$.  
(6) $y = \frac{1}{x}$.  
(7) $\frac{y}{\sqrt{x}} = x$.

Part B, Midsemester exam, 2004

Each of the following questions carries the stated number of marks. Write your answers in the space provided. Part marks will be awarded for correct working.

1. Evaluate $\frac{1}{2} \times \frac{1}{4} + \frac{1}{2} \div \frac{1}{3}$, leaving the answer as a fraction. Show all working. (2 marks)

2. Solve for $x$: $\frac{1}{3x - 4} = \frac{1}{4x - 3}$. (2 marks)
3. Show that: \( \frac{1}{\sqrt{2}} \left( \frac{\sqrt{18}}{3} + \frac{\sqrt{8}}{3} \right) = \left( \frac{3^2 + 4^2}{2^3 + 1^3} \right)^{\frac{1}{2}} \). (4 marks)

4. Simplify \( \frac{a^{-1}b^2}{a^{-3}b^{-2}} \times \frac{1}{(ab)^2} \div a^{-1} \). (4 marks)

5. Removed (not relevant). (3 marks)

6. (a) Find all \( x \) for which \(-3x + 7 > x + 3\), writing your answer in inequality form. (An example of inequality form is \( x > \ldots \)). (2 marks)
   (b) Write your answer to part (a) in interval format. (1 mark)
   (c) Mark your answer to part (a) on the real line. (1 mark)

7. Solve \(|-x - 4| = 6\). (2 marks)

8. Deleted. (3 marks)

9. Write in summation (sigma) notation \( 3x_1 + 6x_2 + 9x_3 + 12x_4 + \ldots + 30x_{10} \). (3 marks)

10. If \( f(x) = 2x \), evaluate and simplify \( \frac{f(x + h) \times f(x - h)}{f(2)} \). (4 marks)

11. Let \( A = \{x \mid x \in \mathbb{Z}, \ x^2 \leq 4\} \), \( B = \{1, 2, 3, 4\} \) and \( C = \{1, 0, -1, -3\} \).
   (a) Explain why \( A = \{-2, -1, 0, 1, 2\} \). (1 mark)
   (b) Mark the sets \( A \), \( B \) and \( C \) on a Venn diagram, with the elements of each set written on the diagram. (2 marks)
   (c) Write down the set \((B \cap C) \setminus A\). (1 mark)
   (d) Write down the set \((A \cup B) \cap C\). (1 mark)
   (e) Write down the set \((B \cup \emptyset) \cup (A \cap \emptyset) \cup (C \cap \emptyset)\). (1 mark)

12. Find the distance between the points \((-\sqrt{2}, -\sqrt{2})\) and \((\sqrt{8}, \sqrt{8})\), expressing your answer in simplest form. (2 marks)

13. Find the equation of the line parallel to \(2(y + 101) = x + y + 2\) and passing through \((-3, -4)\). (3 marks)

14. For \( i \in \mathbb{N}, \) let \( R_i = \sum_{j=1}^{i} j \). Evaluate \( \sum_{k=1}^{3} \frac{1}{R_k} \). (4 marks)

15. Solve the following system of two simultaneous equations:
   \[
   \begin{align*}
   2x - 2y &= 6 \\
   3x &= -5 - 4y.
   \end{align*}
   \] (4 marks)
16.7 Solutions to midsemester exam, 2004

In some cases we use the shorthand notation LHS to mean the left-hand side of the given expression, and RHS to mean the right-hand side.

Part A, Midsemester exam, 2004

Single number answer: In each case we give the value for $x$. After the answers we show the working for some of the harder questions.

1. 6  2. −3  3. 1  4. −5  5. 6  6. −2  7. 2  8. −2  9. −5  10. 3
11. 3  12. 2  13. 0  14. 2  15. 3  16. −1  17. 0  18. −4  19. −2  20. −1
21. 2  22. −3  23. −1 or 0

Working:

4. We cannot take the square root of a negative number, so $-x$ must be positive, so $x$ must be negative. If we take the square root of both sides we get $\sqrt{-x} = \sqrt{5}$. Hence $x = -5$.

5. Substitute 2 in for $a$ in the expression. So $(−2)^2 + 2 = 4 + 2 = 6$.

6. BEDMAS says that we do the squaring before we make $a$ negative. Then substitute 2 in for $a$ in the expression. So $-a^2 + a = -(2^2) + 2 = -4 + 2 = -2$.

7. Substitute $-1$ in for $t$ in the expression. So $t^2 = (-1)^2 = 1$ and $\frac{1}{1/2} = 2$.

8. So $\frac{x}{3} = \frac{-2}{3}$ so $x = -2$.

9. $\pi^3 \div \pi^{-2} = \pi^3 \times \pi^2 = \pi^{3+2} = \pi^5 = \frac{1}{\pi^{-5}}$

10. So $2(x + 1) = 8$, so $2x + 2 = 8$, so $2x = 6$ so $x = 3$.

14. $4^x = (2^2)^x = 2^{2x}$, so $2^{2x} \div 2^5 = 2^{2x-5}$ so $x = 2$.

16. RHS = $4^{x+1} = (2^2)^{x+1} = 2^{2(x+1)} = 2^{2x+2}$. So $2^{x+1} = 2^{2x+2}$. The only time that this can be true is if both powers are equal, so $x + 1 = 2x + 2$, so $x = -1$.

17. We know that $\sqrt{x}$ is always positive, and has range $[0, \infty)$. Hence $x = 0$.

18. The domain represents every point at which it is possible to evaluate the function. This function works everywhere, except where we would have something divided by 0. This occurs when we substitute in $-4$. Hence the domain is everything, except $x = -4$.

19. $1^x = 1$ for every possible value of $x$. Hence $x \times 1 = -2$, so $x = -2$.

21. $3^{n+1} \div 3^{n-1} = \frac{3^{n-1} \times 3^2}{3^{n-1}} = 3^2$, so $x = 2$.

22. $4^{-x} \div 4^x = 4^{-x-x} = 4^{-2x}$, so $x = -3$.

Multichoice.

1. $3y + 6x = 12$, so $3y = -6x + 12$, so $y = -2x + 4$. Hence $m = -2$ and $c = 4$, so answer is (c).

2. Range is all possible values of $f(x)$. Now $|x|$ gives all values from 0 to $\infty$, including 0, so when we subtract 1, we get all values from $-1$ to $\infty$, including $-1$. Hence answer is (d).
3. The domain represents every point at which it is possible to evaluate the function. This function does not work when \( x < 0 \) (as then we would have \( \sqrt{\text{of a negative number}} \)), or when \( x = 0 \) (as then we would be dividing by 0). Hence domain is everything else, which is \( 0 \) to \( \infty \), but not including 0. Hence answer is (f).

4. Answer is (d). All other statements are true, but look at this one. LHS is \( \frac{1}{a} \div \frac{1}{b} = \frac{1}{a} \times \frac{b}{1} = \frac{b}{a} \), whereas RHS is \( (ab)^{-1} = \frac{1}{ab} \).

5. Answer is (b). \(-3\) is an integer, but it is not a natural number.

6. Answer is (f). Simple examples show that none of the others has to be true. For example, try the sets \( A = \{1\} \) and \( B = \{2\} \).

7. Removed (not relevant).

8. Answer is (e). Can’t be (a): for example, 3 and 9 are odd but not relatively prime. Can’t be (b): for example, let \( n = 100 \), so the highest common factor of \( 5n \) and \( 10n \) is 500. Can’t be (c), as 2 is an even prime number. Can’t be (d): for example, 9 and 10 are relatively prime but neither is prime. But for (e), if two numbers are prime then they each have the only factors of 1 and themselves, so their highest common factor must be 1, so they are relatively prime.

9. Answer is (e). Can’t be (a), as LHS equals \( 4x \), not \( 2x \). Can’t be (b), as LHS equals \( 4\sqrt{x} \). Can’t be (c), as LHS cannot be simplified. Can’t be (d), as we know from class this is not true. But (e) is right, as LHS equals \( 4x \).

10. In each case, the \( y \)-coordinate is the same, so the line is horizontal, with equation \( y = \pi^2 \). Hence answer is (e).

Matching graphs with equations. In each case we give the letter of the corresponding graph.

Part B, Midsemester exam, 2004

1. \[ \frac{1}{2} \times \frac{1}{4} + \frac{1}{2} \times \frac{1}{3} = \frac{1}{8} + \frac{3}{8} = \frac{13}{8}. \]

2. \[ \frac{1}{3x - 4} = \frac{1}{4x - 3} \text{ so } 4x - 3 = 3x - 4 \text{ so } x = -1. \]

3. \[ \text{LHS} = \frac{1}{\sqrt{2}} \left( \frac{3\sqrt{2}}{3} + \frac{2\sqrt{2}}{3} \right) = \frac{1}{\sqrt{2}} \left( \frac{5\sqrt{2}}{3} \right) = \frac{5\sqrt{2}}{3\sqrt{2}} = \frac{5}{3} \text{. RHS} = \left( \frac{9 + 16}{8 + 1} \right)^{1/2} = \left( \frac{25}{9} \right)^{1/2} = \frac{5}{3}. \]

4. \[ \text{LHS} = \frac{a^{-1}b^2}{a^{-3b-2}a^{-2b}b^4} \times a^1 = \frac{a^{-1}b^2a^1}{a^{-1}b^2} = \frac{b^2}{a^{-1}b^2} = \frac{1}{a^{-1}} = a. \]

5. Removed (not relevant).

6. (a) \(-3x + 7 > x + 3 \) so \(-4x > -4 \) so \( x < 1. \) (b) \((-\infty, 1)\) (c)

7. \[ |x - 4| = 6 \text{ so } -x - 4 = 6 \text{ or } -x - 4 = -6. \]

Hence \(-x = 10 \) or \(-x = -2 \) so \( x = -10 \) or \( x = 2. \)

8. Deleted.

9. \[ \sum_{i=1}^{10} 3ix_i. \] (But any correct expression is ok.)
10. Now \( f(x + h) = 2(x + h), f(x - h) = 2(x - h) \) and \( f(2) = 2 \times 2 = 4 \). Hence \( \frac{f(x + h) \times f(x - h)}{f(2)} = \frac{2(x + h) \times 2(x - h)}{4} = \frac{4(x + h)(x - h)}{4} = (x + h)(x - h) = x^2 + xh - xh - h^2 = x^2 - h^2 \).

11. **(a)** Those are the integers whose square is less than or equal to 4.

**(b)**

\[
\begin{array}{cccc}
A & -2 & 2 & B \\
0 & 1 & 4 & \phantom{0}
\end{array}
\]

**(c)** The empty set, \( \emptyset \).

**(d)** \{0, -1, 1\} (e) \( B \), which is \{1, 2, 3, 4\}.

12. Let \((x_1, y_1) = (-\sqrt{2}, -\sqrt{2})\) and \((x_2, y_2) = (\sqrt{8}, \sqrt{8})\).

Then \( d = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2} = \sqrt{(-\sqrt{2} - \sqrt{8})^2 + (-\sqrt{2} - \sqrt{8})^2} = \sqrt{(-\sqrt{2} - 2\sqrt{2})^2 + (-\sqrt{2} - 2\sqrt{2})^2} = \sqrt{(-3\sqrt{2})^2 + (-3\sqrt{2})^2} = \sqrt{9 \times 2 + 9 \times 2} = \sqrt{18 + 18} = \sqrt{36} = 6 \).

13. \( 2(y + 101) = x + y + 2 \) so \( y = x - 200 \), so \( m = 1 \). As lines are parallel, new equation is \( y = 1x + c \). Now \((-3, -4)\) is on the line so \(-4 = -3 + c\) so \( c = -1 \) and equation is \( y = x - 1 \).

14. To evaluate the sum, we need \( R_1, R_2 \) and \( R_3 \). Now \( R_1 = \sum_{j=1}^{1} j = 1, R_2 = \sum_{j=1}^{2} j = 1 + 2 = 3 \) and \( R_3 = \sum_{j=1}^{3} j = 1 + 2 + 3 = 6 \).

Hence \( \sum_{k=1}^{3} \frac{1}{R_k} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} = \frac{1}{1} + \frac{1}{3} + \frac{1}{6} = \frac{6}{6} + \frac{2}{6} + \frac{1}{6} = \frac{9}{6} = 1.5 \).

15. To solve: \( 2x - 2y = 6 \) \( (1) \) \( 3x = -5 - 4y \) \( (2) \)

From (1), \( x - y = 3 \) so \( x = y + 3 \). Substitute this into (2), giving \( 3(y + 3) = -5 - 4y \), so \( 3y + 9 = -5 - 4y \), so \( 7y = -14 \) and hence \( y = -2 \).

Substitute \( y = -2 \) into (1) gives us \( 2x + 4 = 6 \) so \( 2x = 1 \) so \( x = 1 \). Hence the solution is \((x, y) = (1, -2)\).

Now we should always check the answer. Substitute \((x, y) = (1, -2)\) into Equations (1) and (2), and see that both equations are satisfied, so the answer **must** be correct.
16.8 Midsemester exam, 2003

Part A, Midsemester exam, 2003

For each of the following 20 questions, find the correct value of \( x \). There is no need to show any working. Each correct answer is worth 1 mark; each incorrect answer is worth 0 marks. (Hint: in each case, \( x \) is an integer between \(-6\) and \( 6\) inclusive.)

1. removed (not relevant)
2. removed (not relevant)
3. \( x = | -\sqrt{25} | \)
4. \((2\sqrt{5})^2 \div x = -5.\)
5. \( x = f(-2) \) where \( f(a) = (-a)^2 + a. \)
6. \( x = f(-2) \) where \( f(a) = -a^2 + a. \)
7. \( x = f(4) \) where \( f(t) = \frac{t}{\sqrt{t}} - t \)
8. \( \frac{x}{3} + 2 = 0. \)
9. \( \pi \times \pi - 2 = \frac{1}{\pi^2} \)
10. \( \frac{1}{x+1} = \frac{2}{8} \)
11. \( \sum_{i=0}^{3} x = -4 \)
12. \( x \) is the highest common factor of 12 and 22
13. \( x \in \{2, 3, 4, 5, 6\} \), \( x \) and 20 are relatively prime.
14. \( 2^x \times 4 = 2^{-3} \)
15. \( \sqrt{-10x} = 2\sqrt{10} \)
16. \( 2^x = 3^x \)
17. \( f(t) = -\sqrt{t} - x \) has range \((-\infty, -4]\)
18. \( f(y) = \frac{1}{2y+6} \) has domain \((-\infty, \infty) \setminus \{x\} \)
19. \( x \times -1^x = 3 \)
20. \( \frac{1}{2} + \frac{1}{3} = \frac{2.5}{x} \)

For each of the following 13 multichoice questions, find the correct answer. There is no need to show any working. Each correct answer is worth 1 mark; each incorrect answer is worth 0 marks.

1. What is the the value of the gradient \((m)\) and \(y\)-intercept \((c)\) of the line \(4y - 8x - 12 = 0.\)
   (a) \( m = -2 \) and \( c = 3. \)  (b) \( m = -2 \) and \( c = -3. \)
   (c) \( m = 2 \) and \( c = 3. \)  (d) \( m = 2 \) and \( c = -3. \)
   (e) \( m = 8 \) and \( c = 12. \)  (f) \( m = -8 \) and \( c = -12. \)
2. Let \( f(x) = x + 1. \) What is the range of \( f(x)? \)
   (a) \([0, \infty).\)  (b) \([1, \infty).\)  (c) \((-\infty, 0) \cup (0, \infty).\)
   (d) \([-1, \infty).\)  (e) \((-\infty, \infty).\)  (f) \((1, \infty).\)
3. Let \( f(x) = \frac{\sqrt{x}}{x+1}. \) What is the domain of \( f(x)? \)
   (a) \((-\infty, -1) \cup (-1, \infty).\)  (b) \([1, \infty).\)  (c) \((-\infty, 0) \cup (0, \infty).\)
   (d) \((-\infty, \infty).\)  (e) \([0, \infty).\)  (f) \((0, \infty).\)
4. Which one of the following statements is true?
   (a) \( \frac{1}{a} + \frac{1}{b} = \frac{1}{a+b} \)
   (b) \( \frac{1}{a} - \frac{1}{b} = \frac{1}{a-b} \)
   (c) \( \frac{1}{a} \div \frac{1}{b} = \frac{a}{b} \)
   (d) \( \frac{1}{a} \div \frac{1}{b} = \frac{1}{ab} \)
   (e) \( \frac{1}{a} + \frac{1}{b} = \frac{ab}{a+b} \)
   (f) \( \frac{1}{a} \div \frac{1}{b} = \frac{b}{a} \)
5. Which one of the following statements is true?
   (a) \( Z \cap N = Z. \)  (b) \( Z \cap R = \emptyset. \)  (c) \( Z \cup N = R. \)
   (d) \( N \cup Z = N. \)  (e) \( N \setminus Z = \emptyset. \)  (f) None of those statements is true.
6. Let \( A \) and \( B \) be sets. Which one of the following statements must be true?
   (a) \( A \cup B \subseteq A. \)  (b) \( A \cup B \subseteq A \cap B. \)
   (c) \( A \cap B \subseteq A \cup B. \)  (d) \( A \cap B \subseteq A \setminus B. \)
   (e) \( (A \cup \emptyset) \cup (B \cup \emptyset) \subseteq A. \)  (f) None of those statements must be true.
7. Removed (not relevant).
8. Which one of the following statements is true?
   (a) Any two even numbers are relatively prime.
   (b) If \( n \) is a positive integer then the highest common factor of \( n \) and \( n^2 \) is \( n \).
   (c) There is no even prime number.
   (d) Any two relatively prime numbers must both be prime.
   (e) All of statements (a), (b), (c) and (d) are true.
   (f) None of statements (a), (b), (c) or (d) is true.

9. Which one of the following statements is true?
   (a) \((\sqrt{3}x)^2 = 3x^2\).
   (b) \(2\sqrt{x} + 2\sqrt{8x} = \sqrt{8x}\).
   (c) \(\sqrt{a} \times (\sqrt{b} \times \sqrt{c}) = \sqrt{a\sqrt{b} + \sqrt{a\sqrt{c}}}\).
   (d) \(\sqrt{a} + \sqrt{b} = \sqrt{a + b}\).
   (e) \(\frac{a}{\sqrt[3]{3}} - \frac{a\sqrt{3}}{3} = \frac{2a\sqrt{3}}{3}\).
   (f) None of statements (a), (b), (c), (d) or (e) is true.

10. The equation of the line passing through the points (2, 3) and (2, 6) is:
   (a) \(x = 2\).
   (b) \(y = 2\).
   (c) \(y = 3\).
   (d) \(y = 6\).
   (e) \(y = 2x + 1\).
   (f) \(y = 3x\).

11. The line passing through the points (0, 1) and (1, 4) has gradient \( m \) and \( y \)-intercept \( c \), where:
   (a) \(m = -1\) and \(c = -3\).
   (b) \(m = -3\) and \(c = -1\).
   (c) \(m = 1\) and \(c = 3\).
   (d) \(m = 3\) and \(c = 1\).
   (e) \(m = 1\) and \(c = 4\).
   (f) \(m = -1\) and \(c = -4\).

12. Let the point \((a, e)\) be on the line \(y_1 = mx + c\), let the point \((a, f)\) be on the line \(y_2 = 2mx + c\) and let the point \((a, g)\) be on the line \(y_3 = mx + 2c\). Which one of the following statements must be true:
   (a) \(f = 2e\).
   (b) \(g = 2e\).
   (c) \(f = e + g\).
   (d) \(f + g = e\).
   (e) \(f + g = 2e\).
   (f) \(f + g = 3e\).

13. If \(x = \frac{2^{n+2}}{2^{n-1}}\), which of the following is true:
   (a) \(x = 2^{-2}\).
   (b) \(x = 2^{-1}\).
   (c) \(x = 2^0\).
   (d) \(x = 2^1\).
   (e) \(x = 2^2\).
   (f) \(x = 2^3\).

The following seven equations have their graphs drawn in the Midsemester 2004 exam paper, in random order, with eight extra graphs included. Match each equation with its graph, by writing the letter of the corresponding graph next to each equation.

- Equation 1 is \(-\sqrt{7} \times y = x\).
- Equation 2 is \(x + \sqrt{6.9} = 5\).
- Equation 3 is \(y = \mid -x \mid\).
- Equation 4 is \(y - 2x + 3 = -\pi\).
- Equation 5 is \(y = (-1)^7 \pi\).
- Equation 6 is \(y = \frac{\pi}{x}\).
- Equation 7 is \(4(y + x) = 2\).

Part B, Midsemester exam, 2003

Each of the following questions carries the stated number of marks. Write your answers in the space provided. Part marks will be awarded for correct working.

1. Evaluate \(\frac{1}{2} - \frac{1}{3} \times \left(\frac{1}{2} \div 2 \div \frac{1}{4}\right)\), leaving the answer as a fraction. Show all working. (2 marks)

2. Solve for \(x\): \(\frac{(-2x - 1)}{(x - 1)} = 1\). (3 marks)
3. Show that: \( \frac{2}{\sqrt{2}} + \frac{2}{\sqrt{4}} + \frac{4}{\sqrt{8}} = 1 + 2\sqrt{2} \). (3 marks)

4. Simplify \( -(xy^2) \div (x^{-1}y^{-2}) \times (xy)^{-2} + x(x^{1/2}y^{-1})^{-2} \). (4 marks)

5. Removed (not relevant). (3 marks)

6. (a) Find all \( x \) for which \(-2x - 2 < x + 4\), writing your answer in inequality form. (An example of inequality form is \( x > \ldots \)). (2 marks)

(b) Write your answer to part (a) in interval format. (1 mark)

(c) Mark your answer to part (a) on the real line. (1 mark)

7. Solve \( |2x + 3| = 5 \). (3 marks)

8. Write in summation (sigma) notation \(-2x - 3x - 4x - 5x - 6x - \ldots - 99x - 100x\). (3 marks)

9. Deleted. (3 marks)

10. If \( f(x) = 2x + 1 \), evaluate and simplify \( \frac{f(x + h) - f(x - h)}{h} \). (3 marks)

11. Let \( A = \{ x \mid x \in \mathbb{Z}, x^2 = 1 \text{ or } x^2 = 4 \}, B = \{ 0, 1, 2, 3, 4 \} \) and \( C = \{ 1, 0, -1, -3 \} \).

(a) Explain why \( A = \{ -2, -1, 1, 2 \} \). (1 mark)

(b) Mark the sets \( A, B \) and \( C \) on a Venn diagram, with the elements of each set written on the diagram. (2 marks)

(c) Write down the set \( B \setminus (A \cap C) \). (1 mark)

(d) Write down the set \( (A \cap B) \cup C \). (1 mark)

(e) Write down the set \( (B \setminus \emptyset) \cap (A \setminus \emptyset) \cap (C \setminus \emptyset) \). (1 mark)

12. Find the distance between the points \((0, 0)\) and \((\sqrt{12}, \sqrt{12})\), expressing your answer as a surd in simplest form. (2 marks)

13. Find the equation of the line perpendicular to \( y - 3x + 4 = 0 \) and passing through the point \((6, -1)\). (3 marks)

14. Let \( x_i = 2i \) for \( i \in \{0, 1, 2, 3\} \). Evaluate \( \sum_{i=0}^{3} \frac{(x_i - 3)^2}{4} \). (4 marks)

15. Solve the following system of two simultaneous equations:

\[
\begin{align*}
8x - 4y &= 3 \\
3x + 2y &= 2.
\end{align*}
\] (4 marks)
16.9 Solutions to midsemester exam, 2003

In some cases we use the shorthand notation LHS to mean the left-hand side of the given expression, and RHS to mean the right-hand side.

Part A, Midsemester exam, 2003

Single number answer: In each case we give the value for \( x \). After the answers we show the working for some of the harder questions.

1. 0  
2. -3  
3. 5  
4. -4  
5. 2  
6. -6  
7. -2  
8. -6  
9. -1  
10. 3  
11. -1  
12. 2  
13. 3  
14. -5  
15. -4  
16. 0  
17. 4  
18. -3  
19. -3  
20. 3

Working:

5. Substitute \(-2\) in for \( a \) in the expression. So \((2)^2 - 2 = 4 - 2 = 2\).

6. BEDMAS says that we do the squaring before we make \( a \) negative. Then substitute \(-2\) in for \( a \) in the expression. So \(-a^2 + a = -(2^2) + -2 = -4 - 2 = -6\).

7. Substitute 4 in for \( t \) in the expression. So \( t\sqrt{t} = 2 \).

8. So \( \frac{x}{3} = -2 \), so \( x = -6 \).

9. \( \pi^3 \times \pi^{-2} = \pi^{3-2} = \pi^1 = \frac{1}{\pi^{-1}} \)

10. So \( 2(x + 1) = 8 \), so \( 2x + 2 = 8 \), so \( 2x = 6 \) so \( x = 3 \).

14. \( 2^x \times 4 = 2^x \times 2^2 = 2^{x+2} = 2^{-3} \) so \( x + 2 = -3 \) so \( x = -5 \).

16. \( 2^x = 3^y \). The only time that this can be true is if both powers are equal to 0.

17. We know that \( \sqrt{t} \) is always positive, and that \(-\sqrt{t}\) has range \((-\infty, 0]\). Hence \( x = 4 \).

18. The domain represents every point at which it is possible to evaluate the function. This function works everywhere, except where we would have something divided by 0. This occurs when we substitute \(-3\). Hence the domain is everything, except \( x = -3 \).

19. \(-1^x = 1\) for every possible even value of \( x \) and \(-1\) for every odd value of \( x \). As \( x \) is obviously 3 or -3 and these are both odd then we have \( x \times -1 = 3 \), so \( x = -3 \).

20. \( \frac{1}{2} + \frac{1}{3} = \frac{3}{6} + \frac{2}{6} = \frac{5}{6} = \frac{2.5}{3} \), so \( x = 3 \).

Multichoice.

1. \( 4y - 8x - 12 = 0 \), so \( 4y = 8x + 12 \), so \( y = 2x + 3 \). Hence \( m = 2 \) and \( c = 3 \), so answer is (c).

2. Range is all possible values of \( f(x) \). Now \( x + 1 \) gives all values from \(-\infty\) to \( \infty \). Hence answer is (e).

3. The domain represents every point at which it is possible to evaluate the function. This function does not work when \( x < 0 \) (as then we would have \( \sqrt{a} \) of a negative number), or when \( x = -1 \) (as then we would be dividing by 0). Hence domain is everything else, which is \( 0 \) to \( \infty \). Hence answer is (e).

4. Answer is (f). All other statements are false, but look at this one. LHS is \( \frac{1}{a} \div \frac{1}{b} = \frac{1}{a} \times b = \frac{b}{a} = RHS \).

5. Answer is (e). Every natural number is also an integer.
Matching graphs with equations. In each case we give the letter of the corresponding graph.

Part B, Midsemester exam, 2003

1. \( \frac{1}{2} - \frac{1}{3} \times \left( \frac{1}{2} \div \frac{2}{4} \right) = \frac{3}{6} - \frac{2}{6} \times \left( \frac{1}{2} \times \frac{1}{4} \right) = \frac{3}{6} - \frac{1}{6} = \frac{2}{6} = \frac{1}{3} \).

2. \( \frac{-2x - 1}{x - 1} = 1 \), so \(-2x - 1 = x - 1 \), so \(-3x = 0 \), so \(x = 0 \).

3. \( \text{LHS} = \frac{2}{\sqrt{2}} + \frac{2}{\sqrt{4}} + \frac{4}{\sqrt{8}} = \frac{2\sqrt{2}}{2} + \frac{2}{2} + \frac{4}{2\sqrt{2}} = \sqrt{2} + 1 + \frac{2}{\sqrt{2}} = 1 + 2\sqrt{2} = \text{RHS} \).

4. \(-xy^2 \div (x^{-1}y^{-2}) \times (xy)^{-2} + x(x^{1/2}y^{-1})^{-2} - xy^2 \times (x^{1/2}y^2) \times (x^{-2}y^{-2}) + x(x^{-1}y^2) = x(x^{1+1-2})y^{2+2-2} + x(1-1)y^2 = -y^2 + y^2 = 0 \).

5. Removed (not relevant).

6. (a) \(-2x - 2 < x + 4 \) so \(-3x < 6 \) so \(x > -2 \).  (b) \((-2, \infty)\)  (c) \([-2, 0)\).

7. \(|2x + 3| = 5 \) so \(2x + 3 = 5 \) or \(2x + 3 = -5 \).
   Hence \(2x = 2\) or \(2x = -8\) so \(x = 1\) or \(x = -4\).

8. \(\sum_{i=2}^{100} -ix\). (But any correct expression is ok.)

10. Now \( f(x + h) = 2(x + h) + 1 = 2x + 2h + 1 \) and \( f(x - h) = 2(x - h) + 1 = 2x - 2h + 1 \). Hence
    \[
    \frac{f(x + h) - f(x - h)}{h} = \frac{2x + 2h + 1 - (2x - 2h + 1)}{h} = \frac{4h}{h} = 4.
    \]

11. (a) Those are the integers whose square is equal to 1 or 4.
    (b) \[
    \begin{array}{c}
    A \hspace{1cm} B \\
    -2 & 3 \\
    2 & 4 \\
    \end{array}
    \]
    (c) \{0, 2, 3, 4\}. (d) \{-3, -1, 0, 1, 2\} (e) \{1\}.

12. Let \((x_1, y_1) = (0, 0)\) and \((x_2, y_2) = (\sqrt{12}, \sqrt{12})\).
    Then \( d = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2} = \sqrt{(0 - \sqrt{12})^2 + (0 - \sqrt{12})^2} = \sqrt{(-\sqrt{12})^2 + (-\sqrt{12})^2} = \sqrt{24} = 2\sqrt{6}. \)

13. \( y - 3x + 4 = 0 \) so \( y = 3x - 4 \), so \( m = 3 \). As lines are perpendicular, new equation is \( y = -\frac{1}{3}x + c \). Now
    \((6, -1)\) is on the line so \(-1 = -\frac{1}{3} \times 6 + c \) so \(-1 = -2 + c \) so \( c = 1 \) and equation is \( y = -\frac{1}{3}x + 1 \).

14. To evaluate the sum, we need \( x_0, x_1, x_2 \) and \( x_3 \). Now \( x_0 = 2 \times 0 = 0, x_1 = 2 \times 1 = 2, x_2 = 2 \times 2 = 4 \) and
    \( x_3 = 2 \times 3 = 6. \)
    Hence
    \[
    \begin{align*}
    \sum_{i=0}^{3} \frac{(x_i - 3)^2}{4} &= \frac{(x_0 - 3)^2}{4} + \frac{(x_1 - 3)^2}{4} + \frac{(x_2 - 3)^2}{4} + \frac{(x_3 - 3)^2}{4} \\
    &= \frac{(0 - 3)^2}{4} + \frac{(2 - 3)^2}{4} + \frac{(4 - 3)^2}{4} + \frac{(6 - 3)^2}{4} \\
    &= \frac{9}{4} + \frac{1}{4} + \frac{1}{4} + \frac{9}{4} = \frac{9 + 1 + 1 + 9}{4} = \frac{20}{4} = 5.
    \end{align*}
    \]

15. To solve:
    \begin{align*}
    8x - 4y &= 3 \quad (1) \\
    3x + 2y &= 2 \quad (2)
    \end{align*}
    Multiply \((2)\) by 2, so \(6x + 4y = 4\). Add this to \((1)\), giving \(8x - 4y + 6x + 4y = 3 + 4 \Rightarrow 14x = 7 \Rightarrow x = \frac{1}{2}. \)
    Substitute \(x = \frac{1}{2}\) into \((1)\) gives us \(8 \times \frac{1}{2} - 4y = 3\) so \(-4y = -4 + 3\) so \(y = \frac{1}{4}. \)
    Hence the solution is \((x, y) = \left(\frac{1}{2}, \frac{1}{4}\right)\).

Now we should always check the answer. Substitute \((x, y) = \left(\frac{1}{2}, \frac{1}{4}\right)\) into Equations \((1)\) and \((2)\), and see that both equations are satisfied, so the answer must be correct.
16.10  Midsemester exam, 2002

Part A, Midsemester exam, 2002

For each of the following thirteen questions, find the correct value of $x$. There is no need to show any working. Each correct answer is worth 1 mark. (Hint: in each case, $x$ is an integer between $-4$ and 4 inclusive.)

1. removed (not relevant)  
2. removed (not relevant)  
3. $x = -|\sqrt{4}|$  
4. $x = f(2)$ where $f(t) = 2t - 2t^2$  
5. $(\{0, 1, 2, 4\} \cap \{1, 4, -1\}) \setminus \{1, 2, x\} = \emptyset$  
6. $2x + 3 = 6 - x$  
7. $4x + 5 = 6x + 5$  
8. $x = f(0)$ where $f(t) = \frac{1}{t - 1} + \frac{1}{t + 1}$  
9. $\sum_{i=1}^{x} i = 10$  
10. $x$ is the highest common factor of 15 and 18  
11. $|\sqrt{32}| \times x = -8\sqrt{2}$  
12. $2^x = \frac{1}{4}$  
13. $8^{2/x} = 4$

For each of the following ten multichoice questions, find the correct answer. There is no need to show any working. Each correct answer is worth 1 mark.

1. What is the the value of the gradient $(m)$ and $y$-intercept $(c)$ of the line $3y - 2x - 1 = 4x - 4$?  
   (a) $m = -2$ and $c = 1$.  
   (b) $m = -2$ and $c = -1$.  
   (c) $m = 2$ and $c = 1$.  
   (d) $m = 2$ and $c = -1$.  
   (e) $m = -2$ and $c = 4$.  
2. Let $f(x) = |x| + 1$. What is the range of $f(x)$?  
   (a) $[0, \infty)$.  
   (b) $[1, \infty)$.  
   (c) $(-\infty, \infty)$.  
   (d) $[-1, \infty)$.  
   (e) $(-\infty, 0) \cup (0, \infty)$.  
3. Let $f(x) = \frac{1}{\sqrt{x}}$. What is the domain of $f(x)$?  
   (a) $(0, \infty)$.  
   (b) $(-\infty, \infty)$.  
   (c) $[0, \infty)$.  
   (d) $(-\infty, 0) \cup (0, \infty)$.  
   (e) $[1, \infty)$.  
4. Which of the following statements is true?  
   (a) $2 \in \mathbb{Z}$ but $2 \notin \mathbb{N}$.  
   (b) $-2 \in \mathbb{Z}$ but $-2 \notin \mathbb{N}$.  
   (c) $-2 \in \mathbb{N}$ but $-2 \notin \mathbb{Z}$.  
   (d) $2 \in \mathbb{N}$ but $2 \notin \mathbb{Z}$.  
   (e) $-2 \in \mathbb{Z}$ and $-2 \in \mathbb{N}$.  
5. Let $A$ and $B$ be sets. Which of the following statements is true?  
   (a) $A \cap B = (A \cup B) \setminus B$.  
   (b) $A \cap B = A \setminus (A \setminus B)$.  
   (c) $A \cap B = (A \setminus B) \cup \emptyset$.  
   (d) Both (a) and (b) are true.  
   (e) Both (b) and (c) are true.  
6. Which of the following statements is true?  
   (a) $\mathbb{R} \subseteq \mathbb{N} \subseteq \mathbb{Z}$.  
   (b) $\mathbb{Z} \subseteq \mathbb{N} \subseteq \mathbb{R}$.  
   (c) $\mathbb{N} \subseteq \mathbb{Z} \subseteq \mathbb{R}$.  
   (d) $\mathbb{R} \subseteq \mathbb{Z} \subseteq \mathbb{N}$.  
   (e) None of statements (a), (b), (c) or (d) is true.  
7. Removed (not relevant).  
8. Which of the following statements is false?  
   (a) 9 and 16 are relatively prime.  
   (b) 7 and 13 are both prime.  
   (c) The highest common factor of 20 and 10 is 10.  
   (d) any two relatively prime numbers must both be prime.  
   (e) any two prime numbers must be relatively prime.
9. Which of the following statements is false?
   (a) \((2\sqrt{2})^2 = 8x\).
   (b) \(\sqrt{x} + \sqrt{x} + \sqrt{x} = \sqrt{9x}\).
   (c) \(\sqrt{a} \times \sqrt{b} \times \sqrt{c} = \sqrt{abc}\).
   (d) \(\sqrt{a} + \sqrt{b} + \sqrt{c} = \sqrt{a+b+c}\).
   (e) \(\frac{1}{\sqrt{a}} + \frac{\sqrt{a}}{a} = \frac{2}{\sqrt{a}}\).

10. The equation of the line passing through the points \((0,0)\) and \((2,4)\) is:
   (a) \(x = 2\).  
   (b) \(y = 4\).  
   (c) \(y = x\).  
   (d) \(y = 2x\).
   (e) \(y = 2x + 4\).

The following seven equations have their graphs drawn below, in random order, with nine extra graphs included. Match each equation with its graph, by writing the letter of the corresponding graph next to each equation. Note that the graphs are labelled A to P.

Equation 1 is \(y = \sqrt{x}\).
Equation 2 is \(y = \sqrt{7} \times x\).
Equation 3 is \(-x + \sqrt{5} = 6.7\).
Equation 4 is \(y = -|x|\).
Equation 5 is \(y = -|x| + 2 + |x|\).
Equation 6 is \(\pi y = -2\pi x - 3\pi\).
Equation 7 is \(y = \frac{1}{-x}\).

Part B, Midsemester exam, 2002

Each of the following questions carries the stated number of marks. Write your answers in the space provided. Part marks will be awarded for correct working.

1. Evaluate \(\left(\frac{1}{2} + \frac{1}{4} \div \frac{1}{2}\right) \div \frac{1}{3}\), leaving the answer as a fraction. Show all working. (2 marks)

2. Solve for \(x\): \(\frac{5}{2x + 4} = (2\sqrt{10})^2 - 8 \times (2 + 3)\). (4 marks)

3. Expand and simplify \(\frac{\sqrt{6} - \sqrt{2}}{\sqrt{3} + 1}\). (3 marks)
4. Simplify \( a(-ab)^3 \div (ab^2) \div b^{-2} \times a^{-3} \). (4 marks)

5. Simplify \( \frac{3^n - 3^{n-1}}{3^{n+1} - 3^{n-1}} \). (3 marks)

6. (a) Find all \( x \) for which \(-2(2x + 4) \geq 2x - 2\), writing your answer in inequality form. (An example of inequality form is \( x > \ldots \)). (3 marks)

(b) Write your answer to part (a) in interval format. (1 mark)

(c) Mark your answer to part (a) on the real line. (1 mark)

7. Removed (not relevant). (5 marks)

8. Write in summation (sigma) notation \( 12i + 10i + 8i + 6i + 4i + 2i - 2i - 4i - 6i \). (4 marks)

9. Deleted. (3 marks)

10. If \( f(x) = x^2 \), evaluate and simplify \( \frac{f(x+h) - f(x)}{h} \). (3 marks)

11. Let \( A = \{-4, 0, 1, -1\} \), \( B = \{-4, -3, 0, 4\} \) and \( C = \{3, 1, -4, 4\} \).

   (a) Mark the sets \( A \), \( B \) and \( C \) on a Venn diagram, with the elements of each set written on the diagram. (3 marks)

   (b) Write down the set \( A \setminus (C \cup B) \). (1 mark)

   (c) Write down the set \( (A \cap B) \setminus (A \cap B \cap C) \). (1 mark)

   (d) Write down the set \( (A \cap C) \cap (A \cup B) \). (1 mark)

   (e) Write down the set \( ((B \cap \emptyset) \cup (A \cup \emptyset)) \setminus (B \setminus \emptyset) \). (1 mark)

12. Find the distance between the points \((-1, -3)\) and \((-6, -8)\), expressing your answer as a surd in simplest form. (2 marks)

13. Find the equation of the line perpendicular to \( y - x = -(x + 1) \) and passing through the point \((-4, -2)\). (3 marks)

14. Do the points \((2, -1), (-3, 9)\) and \((0, 2)\) all lie on the same line? Explain your answer carefully, showing working. (4 marks)

15. Solve the following system of two simultaneous equations:
\[
\begin{align*}
2x + 4y &= -(x + 2y) + 9 \\
-2x - 5y &= -3.
\end{align*}
\] (4 marks)

16. Solve the following system of two simultaneous equations:
\[
\begin{align*}
2a + b &= 2(a - b) + 3b \\
3a + b &= -3(b - a) + 4 + 4b.
\end{align*}
\] (4 marks)
In some cases we use the shorthand notation LHS to mean the left-hand side of the given expression, and RHS to mean the right-hand side.

Part A, Midsemester exam, 2002

Single number answer: In each case we give the value for \( x \). After the answers we show the working for some of the harder questions.

1. 3 2. -2 3. -2 4. -4  
5. 4 6. 1 7. 0 8. 0 9. 4 10. 3 11. -2 12. -2 13. 3

Working:

4. Substitute 2 in for \( t \) in the expression. So \( 2 \times 2 - 2 \times 2^2 = 4 - 8 = -4 \).

5. \((\{0, 1, 2, 4\} \cap \{1, 4, -1\}) \setminus \{1, 2, x\}\) = \((\{1, 4\}) \setminus \{1, 2, x\}\) = \(\emptyset\). Thus \( x = 4 \).

8. Substitute 0 in for \( t \) in the expression. So \( \frac{1}{t-1} + \frac{1}{t+1} = \frac{1}{0-1} + \frac{1}{0+1} = -1 + 1 = 0 \).

11. So \( |\sqrt{32} \times x| = |\sqrt{4 \times 4 \times 2} \times x| = 4\sqrt{2} \times x = 8\sqrt{2} \) so \( x = -2 \).

12. \( 2^x = \frac{1}{4} \) so \( 2^x = \frac{1}{2^2} \) so \( 2^x = 2^{-2} \) so \( x = -2 \).

13. \( 8^{2/x} = 4 \) so \( 2^{2(2/x)} = 2^2 \) so looking at the powers, \( 3 \left( \frac{2}{x} \right) = 2 \) so \( \frac{6}{x} = 2 \). Hence \( x = 3 \).

Multichoice.

1. \( 3y - 2x - 1 = 4x - 4 \), so \( 3y = 6x - 3 \), so \( y = 2x - 1 \). Hence \( m = 2 \) and \( c = -1 \), so answer is (d).

2. Range is all possible values of \( f(x) \). Now \( |x| \) gives all values from 0 to \( \infty \), so adding 1 gives all values from 1 to \( \infty \). Hence answer is (b).

3. The domain represents every point at which it is possible to evaluate the function. This function does not work when \( x < 0 \) (as then we would have \( \sqrt{\text{of a negative number}} \), or when \( x = 0 \) (as then we would be dividing by 0). Hence domain is everything else, which is 0 to \( \infty \) (not including 0). Hence answer is (a).

4. Answer is (b). \(-2\) is an integer, but it is not a natural number.

5. Answer is (b). Simple examples show that none of the others have to be true. For example, try the sets \( A = \{1\} \) and \( B = \{2\} \).

6. Answer is (c).

7. Removed (not relevant).

8. Answer is (d). For example, 9 and 10 are relatively prime but neither is prime.

9. Answer is (d). You can check that the others are all true using simple calculations.

10. Let \( (x_1, y_1) = (0, 0) \) and \( (x_2, y_2) = (2, 4) \). Using the formula from class, the slope is \( m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{4 - 0}{2 - 0} = 2 \). Then \( y = 2x + c \) and substituting the point \( (0, 0) \) in gives \( y = 2x \). Hence the answer is (d).
Matching graphs with equations. In each case we give the letter of the corresponding graph.

Part B, Midsemester exam, 2002

1. \( \left( \frac{1}{2} + \frac{1}{4} \div \frac{1}{2} \right) \div \frac{1}{3} = \left( \frac{1}{2} + \frac{1}{4} \times 2 \right) \times 3 = \left( \frac{1}{2} + \frac{1}{2} \right) \times 3 = 3. \)

2. \( \frac{5}{2x + 4} = (2\sqrt{10})^2 - 8 \times 5 \) so \( \frac{5}{2x + 4} = (40) - 40 \) so \( \frac{5}{2x + 4} = 0 \) so \( 5 = 0 \), which is impossible. Hence there is no solution.

3. \( \frac{(\sqrt{6} - \sqrt{2})(\sqrt{3} + 1)}{\sqrt{2}} = \frac{(\sqrt{6} \times \sqrt{3}) + (1 \times \sqrt{6}) - ((\sqrt{2} \times \sqrt{3}) - (\sqrt{2} \times 1)}{\sqrt{2}} = \frac{3\sqrt{2} + \sqrt{6} - \sqrt{6} - \sqrt{2}}{\sqrt{2}} = \frac{2\sqrt{2}}{2} = 2. \)

4. \( a(-ab)^3 \div (ab)^2 \times a^{-3} = a(-a^3b^3) \times a^{-1}b^{-2} \times b^2 \times a^{-3} = -a^{1+3-1-3}b^{3-2+2} = -b^3. \)

5. \( \frac{3^n - 3^{n-1}}{3^{n+1} - 3^{n-1}} = \frac{3^n - 1}{9^n - 1} = \frac{3 - 1}{9 - 1} = \frac{2}{8} = \frac{1}{4}. \)

6. (a) \(-2(2x + 4) \geq 2x - 2 \) so \(-4x - 8 \geq 2x - 2 \) so \(-6x \geq 6 \) so \( x \leq -1 \).  
(b) \((-\infty, -1]\)

7. Removed (not relevant).

8. \( \sum_{j=3}^{6} 2ji. \) (But any correct expression is ok.)

10. Now \( f(x + h) = (x + h)^2 = x^2 + h^2 + 2xh. \) Hence \( \frac{f(x + h) - f(x)}{h} = \frac{x^2 + h^2 + 2xh - x^2}{h} = \frac{h^2 + 2xh}{h} = h + 2x. \)

11. (a) \( \{-1\} \) (b) \( \{0\} \) (c) \( \{0\} \) (d) \( \{-4, 1\} \) (e) \( \{-1, 1\} \)

12. Let \( (x_1, y_1) = (-1, -3) \) and \( (x_2, y_2) = (-6, -8) \).
Then \( d = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2} = \sqrt{(-1 + 6)^2 + (-3 + 8)^2} = \sqrt{5^2 + (5)^2} = \sqrt{25 + 25} = \sqrt{50} = 5\sqrt{2}. \)

13. \( y - x = -(x + 1) \) so \( y = -1 \), so the slope is zero and line is horizontal. As lines are perpendicular, new line must be vertical. Hence, as \( (-4, -2) \) is on line, equation must be \( x = -4. \)

14. Assume that \( (2, -1) \) and \( (-3, 9) \) lie on the same line. Then from class we know that \( m = \frac{10}{-5} = -2. \) So the equation of the line is \( y = 2x + c \), and substituting in the point \( (2, -1) \) we get \(-1 = -2 \times 2 + c \) so \( 3 = c \), so the equation is \( y = -2x + 3 \). If all the points are on the same line then \( (0, 2) \) must satisfy this equation. But it doesn’t: when \( x = 0 \) we would have \( y = 3 \), instead of \( y = 2 \). Hence the points \( (2, -1), (-3, 9) \) and \( (0, 2) \) do not all lie on the same line. Note: You can start with any two of the three points and reach the same conclusion.
15. To solve: \[ \begin{align*} 2x + 4y &= -(x + 2y) + 9 & (1) \\ -2x - 5y &= -3 & (2) \end{align*} \]

From (1), \[2x + 4y = -x - 2y + 9\] so \[3x = -6y + 9\] so \[x = -2y + 3\]. Substitute this into (2), giving \[-2(-2y + 3) - 5y = -3,\] so \[4y - 6 - 5y = -3,\] so \[-y = 3,\] hence \[y = -3\].

Substitute \(y = -3\) into (1) gives us \[2x + 4 \times -3 = -(x + 2 \times -3) + 9\] so \[2x - 12 = -x + 6 + 9\] so \[3x = 27,\] hence \[x = 9\]. Hence the solution is \((x, y) = (9, -3)\).

Now we should always check the answer. Substitute \((x, y) = (9, -3)\) into Equations (1) and (2), and see that both equations are satisfied, so the answer **must** be correct.

16. To solve: \[ \begin{align*} 2a + b &= 2(a - b) + 3b & (1) \\ 3a + b &= -3(b - a) + 4 + 4b & (2) \end{align*} \]

From (1), \[2a + b = 2a - 2b + 3b\] we get that \(b = b\) (which is obvious and not very helpful).

From (2), \[3a + b = -3b + 3a + 4 + 4b\] so \[3a + b = 3a + b + 4\] so we get that \(0 = 4,\) which is impossible. Hence the two simultaneous equations (1) and (2) have no solution.
1. Answer each of the following questions. Each part is worth 1 mark.

(a) Find all $x$ for which $-x - 3 < 1$.

(b) If $f(x) = -x^2 - x$, find $f(2)$.

(c) If $f(x) = -x^2 - x$, find $f(-1)$.

(d) Find all values of $x$ for which $(3x - 1)(4x + 3) = 0$.

(e) Explain briefly why $\log_{10} 100 = 2$.

(f) Find $\log_{16} 4$.

(g) Explain briefly why $\ln 1 = 0$.

(h) Find the derivative of $f(x) = 3x^2 - 6x + e^x$.

2. Below are eight equations, with their graphs drawn below the equations, in random order, with eight extra (unused) graphs included. Match each equation with its graph, by writing the letter of the corresponding graph next to each equation. Note that the graphs are labelled A to P. (8 marks)

- $y = \pi^2 + 2\pi + 1$
- $y = -2x$
- $y = -x^2 + 4$
- $x = \sqrt{69}$
- $y = |x| - 2$
- $-y + x + 2 = 0$
- $4y = -3x$
- $13x = -5y - 4^8$

3. Find the equation of the line passing through the points $(-1, -1)$ and $(-2, -7)$. (3 marks)

4. (a) Find the domain of $f(x) = \frac{1}{\sqrt{x} - 2}$. Write your answer in interval format. (2 marks)

(b) Find the range of $g(x) = |x| - 2$. Write your answer in interval format. (2 marks)

5. Let $f(x) = (x - \sqrt{12})(x + \sqrt{3})$.

(a) Expand and simplify $f(x)$. (4 marks)

(b) Find $f(\sqrt{3})$, expressing your answer as a surd in simplest form. (3 marks)

6. (a) Solve the following system of two simultaneous equations.

$$
2x + 5y = 6
$$
$$
3x + 4y = 9
$$

(4 marks)
(b) Solve the following system of two simultaneous equations.
\[ x + \frac{y}{2} = 2 \]
\[ -2x - y = -4 \]  
(3 marks)

(c) Find the \( x \) and \( y \) coordinates of two points that satisfy the equations in Part (b).  
(2 marks)

7. Simplify the following, **without using a calculator:**  
\[ e^2(e^3 + e^{-2}) - \frac{e}{(e^{-3})^2}. \]  
(3 marks)

8. Let \( f(x) = x^2 - 4 \), and let \( g(x) = 2(x - 1) \). Find and simplify \( f(g(x)) \).  
(4 marks)

9. I have $1000 to invest for 5 years. Bank A pays interest at 12% per annum, compounding annually for 2 years, then compounding continuously for the next 3 years. Bank B pays interest at 12% per annum, compounding monthly for 5 years. Which is the better investment strategy, and by how much? (Ignore all fees and taxes.)

(Hint: \( 1.12^2 \approx 1.254 \), \( 1.12^5 \approx 1.762 \), \( 1.12^{60} \approx 897.597 \).
\( 1.015^5 \approx 1.051 \), \( 1.0136^5 \approx 1.431 \), \( 1.01^{60} \approx 1.817 \).
\( e^{0.12} \approx 1.128 \), \( e^{0.36} \approx 1.433 \), \( e^{0.6} \approx 1.822 \).)  
(6 marks)

10. I toss a fair coin 6 times in a row. In each of Parts (a) to (c), find the probability that:

(a) All 6 tosses come up Heads?  
(2 marks)

(b) The first 5 tosses are Heads or the last 5 tosses are Heads (or both)?  
(2 marks)

(c) All 6 tosses are Heads given that the first 4 tosses are Heads?  
(2 marks)

11. Find \( R \) if \( \frac{1 + R}{R} = \sum_{i=1}^{3} \frac{1}{2i-1} \). (Leave your answer as a fraction; show all working.)  
(5 marks)

12. Let \( f(x) = x^2 - 5 \).

(a) Find \( f(-2) \).  
(1 mark)

(b) Solve \( f(x) = 20 \).  
(2 marks)

(c) Solve \( |f(x)| = 4 \).  
(4 marks)

13. In each of Parts (a), (b) and (c) find \( y' \), **simplifying where possible**.

(a) \( y = 2(e^{2x} + 1)^9 \)  
(3 marks)

(b) \( y = \frac{x^2 - x + 1}{x + 1} \)  
(4 marks)

(c) \( y = \sqrt{e^{x}} \).  
(3 marks)

14. Let \( y = 2x^3 + 3x^2 - 12x + 6 \). Find and classify all critical points of \( y \). (Your answer should include the \( x \) and \( y \)-coordinates of all critical points.)  
(7 marks)

15. Find each of the following integrals.
(a) \[ \int (6x - 2) \, dx \]  
(1 mark)

(b) \[ \int \left( \frac{2}{x} + e^{-x} \right) \, dx \]  
(2 marks)

(c) \[ \int_{1}^{4} \sqrt[3]{x} \, dx \]  
(4 marks)

16. A rocket takes off vertically at time \( t = 0 \) with acceleration \( a(t) = pt + 2 \), where \( p \) is a constant. When \( t = 0 \) the rocket has velocity \( v(0) = 0 \) and displacement \( S(0) = 0 \). When \( t = 1 \) the rocket has displacement \( S(1) = 5 \).

(a) Find the value of \( p \).  
(7 marks)

(b) How far does the rocket travel between \( t = 1 \) and \( t = 2 \)?  
(2 marks)

17. Let \( f(x) = (x^2 + 2x - 1)e^{-x} \). Find the \( x \)-coordinates of the point(s) at which the value of \( f(x) \) is equal to the derivative of \( f(x) \). (There is no need to find the \( y \)-coordinates.)  
(6 marks)

18. The following diagram shows the graph of the derivative \( f'(x) \) of a function \( f(x) \) on the interval \( x \in [-3.5, 3.5] \).

(a) How many critical points does the function \( f(x) \) have on this interval?  
(2 marks)

(b) Write down the (approximate) \( x \)-coordinate(s) of the point(s) at which the function \( f(x) \) has a local maximum.  
(2 marks)

(c) Write down, in interval format, the (approximate) interval(s) on which the function \( f(x) \) is decreasing.  
(2 marks)

(d) Write down the (approximate) \( x \)-coordinate(s) of the point(s) at which the function \( f(x) \) has its steepest negative slope.  
(2 marks)

(e) Write down the (approximate) \( x \)-coordinate(s) of the point(s) at which the second derivative \( f''(x) \) is equal to 0.  
(3 marks)
16.13 Solutions to final exam, June 2006

1. (a) \(-x - 3 < 1\), so \(-x < 4\), so \(x > -4\).
   (b) \(f(2) = -(2^2) - 2 = -6\).
   (c) \(f(-1) = -(-1^2) + 1 = 0\).
   (d) \((3x - 1) = 0\) or \((4x + 3) = 0\), so \(x = 1/3\) or \(x = -3/4\).
   (e) \(100 = 10^2\), so \(2\) is the power to which we raise \(10\) in order to get \(100\). Hence the log (to base 10) of \(100\) is \(2\).
   (f) \(4 = 16^{1/2}\), so \(\log_{16} 4 = 1/2\).
   (g) Anything to the power 0 equals 1, so \(e^0 = 1\), so \(\log 1 = 0\).
   (h) \(f'(x) = 6x - 6 + e^x\).

2. (1) Graph O  (2) Graph G  (3) Graph N  (4) Deleted
   (5) Graph M  (6) Graph A  (7) Graph L  (8) Graph F

3. Let \((x_1, y_1) = (-1, -1)\) and \((x_2, y_2) = (-2, -7)\). Then \(m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{-7 - (-1)}{-2 - (-1)} = \frac{-6}{-1} = 6\). Hence equation is \(y = 6x + c\). Now \((-1, -1)\) is on the line, so \(-1 = 6 \times -1 + c\), so \(c = 5\).
   Hence the answer is \(y = 6x + 5\).

4. (a) We cannot find the square root of a negative number, and cannot divide by 0. Hence we must have \(x \geq 0\) and \(\sqrt{x - 2} \neq 0\). Hence \(x \geq 0\) and \(x \neq 4\). In interval format, this is \([0, 4)\cup(4, \infty)\).
   (b) We know that \(|x| \geq 0\). Hence the range is \([-2, \infty)\).

5. (a) \(f(x) = x^2 + \sqrt{3}x - 2\sqrt{3}x - \sqrt{36} = x^2 - \sqrt{3}x - 6\).
   (b) \(f(\sqrt{3}) = 3 - 3 - 6 = -6\).

6. (a) Multiplying the first equation by \(-3\) and the second equation by \(2\) gives \(-6x - 15y = -18\) and \(6x + 8y = 18\). Adding these gives \(-7y = 0\), so \(y = 0\) and hence \(x = 3\). Hence the solution is \((3, 0)\), which is checked by substituting into both equations.
   (b) Multiplying the first equation by \(-2\) gives \(-2x - y = -4\), which is identical to the second equation. Hence there is an infinite number of solutions.
   (c) Any point on the first line will also be on the second line, so we can find any two such points that we want. For example, substitute \(x = 0\) into the first equation, giving \(y = 4\), so \((0, 4)\) is one such point. Then substitute \(y = 0\) into the equation giving \(x = 2\), so \((2, 0)\) is a second point.

7. \(e^2 (e^3 + e^{-2}) - \frac{e}{(e^3)^2} = e^{3+2} + e^{-2+2} - \frac{e}{e^{-6}} = e^5 + e^0 - e^7 = e^5 + 1 - e^7\).

8. \(f(g(x)) = (2(x - 1))^2 - 4 = 4(x^2 - 2x + 1) - 4 = 4x^2 - 8x\).

9. For Bank A, after two years the balance is \(1000(1 + 0.12)^2 = 1254\). Then this amount is invested at continuous compounding for three more years, so the final balance is \(1254e^{0.12 \times 3} = 1254e^{0.36} = 1797.40\).
   For Bank B, after 5 years the balance is \(1000(1 + 0.12/12)^{5 \times 12} = 1000(1.01)^{60} = 1817\).
   Hence Bank B is the better strategy, by \(1817 - 1797.40 = $19.60\).

10. I toss a fair coin 6 times in a row. In each of Parts (a) to (c), find the probability that:
    (a) Prob equals \((1/2)^6 = 1/64\).
(b) Prob(first 5 are heads) equals \((1/2)^5 = 1/32\).
Prob(last 5 are heads) equals 1/32.
By the principle of inclusion/exclusion, Prob(first 5 heads OR last 5 heads) equals \(1/32 + 1/32 - 1/64 = 3/64\).

(c) All tosses are independent, so if first 4 are heads, Prob(all heads) = Prob(last two are heads) equals \((1/2)^2 = 1/4\).

11. \(RHS = \sum_{i=1}^{3} \frac{1}{2i-1} = \frac{1}{2-1} + \frac{1}{4-1} + \frac{1}{6-1} = \frac{1}{1} + \frac{1}{3} + \frac{1}{5} = \frac{15}{15} + \frac{5}{15} + \frac{3}{15} = \frac{23}{15}\)

Hence \(\frac{1 + R}{R} = \frac{23}{15}\), so \(15(1 + R) = 23R\), so \(15 + 15R = 23R\), so \(15 = 8R\), so \(R = \frac{15}{8}\).

12. Let \(f(x) = x^2 - 5\).

(a) \(f(-2) = 4 - 5 = -1\).
(b) \(f(x) = 20\), so \(x^2 - 5 = 20\), so \(x^2 = 25\), so \(x = 5\) or \(x = -5\).
(c) \(|f(x)| = 4\), so \(|x^2 - 5| = 4\), so \(x^2 - 5 = 4\) or \(x^2 - 5 = -4\). Solve each of these separately.

If \(x^2 - 5 = 4\) then \(x^2 = 9\) so \(x = 3\) or \(x = -3\). If \(x^2 - 5 = -4\) then \(x^2 = 1\), so \(x = 1\) or \(x = -1\).

Hece the answer is \(x = -3, x = -1, x = 1\) or \(x = 3\).

13. (a) \(y' = 2 \times 6 \times 3 \times (e^{2x} + 1)^8 = 36e^{2x}x(e^{2x} + 1)^8\).
(b) Let \(u = x^2 - x + 1\) and \(v = x + 1\), so \(u' = 2x - 1\) and \(v' = 1\). By the quotient rule, \(y' = \frac{u'v - uv'}{v^2} = \frac{(2x-1)(x+1) - (x^2-x+1)(2x+2x-1)}{(x+1)^2} = \frac{x^2 + 2x - 2}{(x+1)^2}\).
(c) There is a trick here. Note that the function can be rewritten as \(y = \left(\frac{1}{2}\right)^{1/2} = e^{0.5x}\). Then \(y' = 0.5e^{0.5x}\).

14. First, \(y' = 6x^2 + 6x - 12\). At a critical point we have \(y' = 0\), so \(6x^2 + 6x - 12 = 0\). We can cancel through by 6, giving \(x^2 + x - 2 = 0\). This is a quadratic equation, with coefficients \(a = 1\), \(b = 1\) and \(c = -2\). Use the quadratic formula (or factoring) to solve this, giving \(x = 1\) or \(x = -2\).

From above, critical points occur at \(x = 1\) and \(x = -2\). To classify these, note that \(y'' = 12x + 6\). When \(x = 1\), \(y''\) is positive, so there is a local minimum. When \(x = -2\), \(y''\) is negative, so there is a local maximum.

Finally, we need to find the \(y\)-coordinates of the critical points. When \(x = 1\), \(y(1) = 6 + 6 - 12 = 0\), so \((1, 0)\) is a local minimum. When \(x = -2\), \(y(-2) = 6 \times (-2)^2 - 12 - 12 = 24 - 24 = 0\), so there is a local maximum at \((-2, 0)\).

15. (a) \(\int (6x - 2) \, dx = 3x^2 - 2x + C\)
(b) \(\int \left(\frac{2}{x} + e^{-x}\right) \, dx = 2 \ln x - e^{-x} + C\)
(c) \(\int \sqrt{x} \, dx = \left[3 \times 2/3 \times x^{3/2}\right]_1^4 = \left[2\sqrt{3}\right]_1^4 = 2\sqrt{4^3} - 2\sqrt{1^3} = 2 \times 8 - 2 \times 1 = 14\).

16. A rocket takes off vertically at time \(t = 0\) with acceleration \(a(t) = pt + 2\), where \(p\) is a constant. When \(t = 0\) the rocket has velocity \(v(0) = 0\) and displacement \(S(0) = 0\). When \(t = 1\) the rocket has displacement \(S(1) = 5\).

(a) \(v = \int v \, dt = \int pt + 2 \, dt = \frac{pt^2}{2} + 2t + C\). Now \(v(0) = 0\), so \(C = 0\). Hence \(v(t) = \frac{pt^2}{2} + 2t\).

\(S = \int v \, dt = \int \frac{pt^2}{2} + 2t \, dt = \frac{pt^3}{6} + t^2 + D\). Now \(S(0) = 0\), so \(D = 0\), and hence \(S(t) = \frac{pt^3}{6} + t^2\).

Finally, \(S(1) = 5\), so \(p \times \frac{1^3}{6} + 1^2 = 5\), so \(p = 4\), so \(p = 24\).
(b) Because \( p = 24 \), we have \( S(t) = \frac{pt^3}{6} + t^2 = \frac{24t^3}{6} + t^2 = 4t^3 + t^2 \).

At \( t = 2 \), \( S(2) = 4 \times 2^3 + 2^2 = 36 \). At \( t = 1 \), we are given that \( S(1) = 5 \). Hence between \( t = 1 \) and \( t = 2 \) the rocket travels \( 36 - 5 = 31 \).

17. First we need to use the product rule to find the derivative.

Let \( u(x) = x^2 + 2x - 1 \) and \( v(x) = e^{-x} \), so \( u' = 2x + 2 \) and \( v' = -e^{-x} \).

Then \( y' = u'v + uv' = (2x + 2)e^{-x} + (x^2 + 2x - 1) \times -e^{-x} = e^{-x}(2x^2 + 2x + 2 - x^2 - 2x + 1) = e^{-x}(-x^2 + 3) \).

Now, when the value of \( f(x) \) equals the slope of \( f(x) \), we have \( (x^2 + 2x - 1)e^{-x} = e^{-x}(-x^2 + 3) \).

Because \( e^{-x} \) never equals 0 we can cancel \( e^{-x} \), giving \( x^2 + 2x - 1 = (-x^2 + 3) \), so \( 2x^2 + 2x - 4 = 0 \), so \( x^2 + x - 2 = 0 \). This is a quadratic equation, which can be solved (using the quadratic formula or factoring) to give \( x = 1 \) or \( x = -2 \).

Hence when \( x = 1 \) and \( x = -2 \), the value of \( f(x) \) equals the slope of \( f(x) \).

18. (a) The function has a critical point when the derivative equals zero, which happens 4 times in the diagram.

(b) At a local maximum, the value of the derivative should be positive, then zero, then negative. This happens at \( x = -3 \) and \( x = 1 \).

(c) The function is decreasing when the derivative has a negative value. This happens on the intervals \([-3, -1]\) and \([1, 3]\).

(d) This happens when the derivative has its largest negative values, which occurs when \( x = -2 \) and \( x = 2 \).

(e) The second derivative equals zero when the derivative has a local maximum or minimum. This happens when \( x = -2 \), \( x = 0 \) and \( x = 2 \).
1. Find \( R \) if \( R = \sum_{i=-2}^{1} \frac{|i|}{2i+1} \). (3 marks)

2. (a) Find all \( x \) such that \(-3x - 4 \geq -2(x - 3)\). (3 marks)

(b) Write your answer to Part (a) in interval format. (1 mark)

(c) Mark your answer to Part (a) on the real line. (1 mark)

3. For each of Parts (a) to (f), let

\[
A = \{x \mid x \in \mathbb{N}, x \leq 10 \text{ and } x \text{ is even}\},
\]

\[
B = \{x \mid x \in \mathbb{N}, x \leq 10 \text{ and } x \text{ is divisible by 3}\}, \text{ and}
\]

\[
C = \{x \mid x \in \mathbb{N} \text{ and } 3 \leq x \leq 6\}.
\]

(a) Write down the sets \( A, B \) and \( C \), by listing their elements. (2 marks)

(b) Mark the elements of the sets \( A, B \) and \( C \) on a Venn diagram. (2 marks)

(c) Write down the elements of the set \((A \cap B) \cup C\). (2 marks)

(d) Write down the elements of the set \((A \setminus B) \setminus (C \cap A)\). (2 marks)

(e) Let \( x \) be a natural number between 1 and 10 (inclusive) chosen at random. In each of Parts (i), (ii) and (iii), find the probability that:

(i) \( x \in A \cup B \). (2 marks)

(ii) \( x \) is both even and divisible by 3. (2 marks)

(iii) \( x \in C \) given that \( x \in A \). (2 marks)

(f) Let \( x \) and \( y \) each be a natural number between 1 and 10 (inclusive) chosen independently at random. In each of Parts (i) and (ii), find the probability that:

(i) both \( x \) and \( y \) are divisible by 3. (2 marks)

(ii) \( x \in A \) or \( y \in C \) (or both). (2 marks)

4. Solve the following system of two simultaneous equations.

\[
3x - 4y = 5
\]

\[
5x - 3y = 1.
\]

(4 marks)

5. Find the equation of the line passing through the points \((1, 1)\) and \((-2, 7)\). (3 marks)

6. Let \( f(x) = (x - \sqrt{8})(x + \sqrt{2}) \).

(a) Expand and simplify \( f(x) \). (3 marks)

(b) Find \( f(\sqrt{6}) \), expressing your answer as a surd in simplest form. (2 marks)

7. Shown below are two copies of the graph of \( y = \sin x \), for \( x \in [-2\pi, 2\pi] \). In each of Parts (a) and (b), sketch your graph on the set of axes. Note: to save space, the diagram is only shown for Part (a).

(a) Sketch a graph of \( y = \frac{1}{2} \sin \left( \frac{1}{2} x \right) \) for \( x \in [-2\pi, 2\pi] \). (2 marks)
8. Let \( f(x) = x^2 - 3 \).
   (a) Using limits, show that the derivative of \( f \) is \( f'(x) = 2x \).
   (4 marks)
   (b) Find the equation of the line that is tangential to \( f \) at the point \((0, -3)\).
   (2 marks)

9. The following diagram shows the graph of a function \( f(x) \) on the interval \( x \in [-2, 3] \). Parts (a) to (d) contain questions about the derivative \( f'(x) \) on this interval.

   (a) Find the (approximate) \( x \)-coordinate(s) of the point(s) at which \( f'(x) = 0 \)? (2 marks)
   (b) Write down the (approximate) interval(s) on which \( f' \) is negative. (2 marks)
   (c) The derivative \( f' \) has a critical point between \( x = 1 \) and \( x = 2 \). Is this critical point a local maximum or local minimum (of \( f' \))? Briefly explain your answer. (2 marks)
   (d) Rewrite these values in increasing order: \( f'(3), f'(1), f'(0), f'(-2) \). (2 marks)

10. In each of Parts (a) to (c), find \( \frac{dy}{dx} \), simplifying where possible. (2 marks, 3 marks, 4 marks)
   (a) \( y = -2x^4 + 6x + 1 \)
   (b) \( y = \cos(\sqrt{x}) \)
   (c) \( y = x \ln x - x \)

11. In each of Parts (a) and (b), find \( \frac{dy}{dx} \), simplifying where possible. (2 marks, 3 marks)
   (a) \( y = 3(x^2 + 1)^4 \)
   (b) \( y = \frac{x^2 - 1}{x^2 + 1} \)

12. Here are eight equations, with their graphs drawn below the equations, in random order, with eight extra (unused) graphs included. Match each equation with its graph. (8 marks)
   (1) \( y = x^2 + 1 \)
   (2) \( y = e^{2x} \)
   (3) \( 0.001y - 0.004x = 0.002 \)
   (4) \( y = -2 \quad | x | \)
   (5) \( x - y = 0 \)
   (6) \( y = \pi^2 \)
   (7) \( x = \sqrt{27} \)
   (8) \( y = 3^{-x} \)
13. A rocket takes off vertically at time \( t = 0 \) with acceleration \( a(t) = 6t + 2 \). When \( t = 1 \) the rocket is travelling with velocity \( v(1) = 7 \) and has displacement \( S(1) = 7 \).

(a) Find an expression for the velocity of the rocket at any time \( t \). (3 marks)

(b) How far does the rocket travel between \( t = 1 \) and \( t = 2 \)? (4 marks)

(c) At what time(s) does the velocity of the rocket equal 10? (3 marks)

14. Find each of the following integrals. (1 mark, 2 marks, 3 marks, 4 marks)

(a) \( \int (4x + 3) \, dx \)

(b) \( \int \left( \frac{1}{x} + 2e^{-2x} \right) \, dx \)

(c) \( \int_{0}^{1} (e^x + e^{-x}) \, dx \)

(d) \( \int_{-1}^{1} (x + x^2 + x^3) \, dx \)

15. For each of Parts (a) to (d), assume that an initial amount of $1000 is invested in an account earning 10% per annum (with no taxes or fees). (It may help to note that \( e^{0.3} \approx 1.35, 1.1^3 \approx 1.33 \) and \( 1.05^8 \approx 1.34 \).) All four parts are worth 1 mark each.

(a) What will be the balance \( F \) in the account after 3 years, if interest compounds annually?

(b) What will be the balance \( F \) in the account after 3 years, if interest compounds each six months?

(c) What will be the balance \( F \) in the account after 3 years, if interest compounds continuously?

(d) Briefly explain why your answer to Part (c) should be larger than your answer to Part (a)?

16. For each of Parts (a) to (d), let \( y = (x^2 - 2x + 1)e^x \).

(a) Show that \( y' = (x^2 - 1)e^x \). (4 marks)

(b) Find all values of \( x \) for which \( y' = 0 \). (2 marks)

Recall that \( y = (x^2 - 2x + 1)e^x \) and \( y' = (x^2 - 1)e^x \).

(c) Find \( y'' \). (3 marks)

(d) Hence (or any way that you like), find and classify all critical points of \( y \). (3 marks)

17. Find the point(s) at which the circle with centre \((0, 0)\) and radius \( \sqrt{5} \) intersects the curve \( y = x^2 + 1 \). (6 marks)
16.15 Solutions to final exam, June 2005

1. \[ R = \sum_{i=-2}^{1} \frac{|i|}{2x+1}, \text{ so } R = \frac{|-2|}{2x-2+1} + \frac{|-1|}{2x-1+1} + \frac{|0|}{2x+0+1} + \frac{|1|}{2x+1+1}. \text{ so } R = \frac{2}{-3} + \frac{1}{1} + \frac{0}{1} + \frac{1}{3}, \text{ so } R = \frac{-1}{3} - \frac{1}{3} - \frac{3}{3}, \text{ so } R = \frac{-2}{3}. \]

2. (a) \(-3x - 4 \geq -2(x - 3), \text{ so } -3x - 4 \geq -2x + 6, \text{ so } -x \geq 10, \text{ so } x \leq -10.

(b) \((\infty, -10).

(c) \[ A = \{2, 4, 6, 8, 10\}, B = \{3, 6, 9\} \text{ and } C = \{3, 4, 5, 6\}. \]

3. \( (a) \) \( \{2, 4, 6, 8, 10\} \text{ and } \{3, 6, 9\} \text{ and } \{3, 4, 5, 6\}. \)

\[ (b) \ (c) \ \{3, 4, 5, 6\}. \]

4. To solve: \[ 3x - 4y = 5 \] \[ 5x - 3y = 1 \]

Multiplying (1) by 5 gives 15x - 20y = 25 and multiplying (2) by -3 gives -15x + 9y = -3. Adding these together gives -11y = 22, so y = -2.

Substitute y = -2 into (1) gives us 3x - 4 \times -2 = 5, so 3x + 8 = 5 so 3x = -3, so x = -1.

Hence the solution is \((x, y) = (-1, -2).\)

Now we should always check the answer. Substitute \((x, y) = (-1, -2)\) into Equations (1) and (2), and see that both equations are satisfied, so the answer must be correct.

5. Let \((x_1, y_1) = (1, 1)\) and \((x_2, y_2) = (-2, 7)\). From the notes \[ m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{7 - 1}{-2 - 1} = \frac{6}{-3} = -2. \] So the equation is \(y = -2x + c.\) Substitute in the point (1, 1), so \(1 = -2 \times 1 + c, \text{ so } 1 = -2 + c, \text{ so } c = 3.\) The equation is \(y = -2x + 3.\)

6. \( (a) \ f(x) = (x-\sqrt{8})(x+\sqrt{2}), \) so \( f(x) = x \times x + x \times \sqrt{2} - \sqrt{8} \times x - \sqrt{8} \times \sqrt{2}, \) so \( f(x) = x^2 + \sqrt{2} \times x - \sqrt{8} \times \sqrt{2}, \) so \( f(x) = x^2 + \sqrt{2} \times x - \sqrt{8} \times \sqrt{2}, \) so \( f(x) = x^2 + \sqrt{2} \times x - \sqrt{8} \times \sqrt{2}, \) so \( f(x) = x^2 + \sqrt{2} \times x - \sqrt{8} \times \sqrt{2}, \)

\( (b) \ f(\sqrt{6}) = (\sqrt{6})^2 - \sqrt{2} \times \sqrt{6} - 4, \) so \( f(\sqrt{6}) = 6 - \sqrt{2} \times \sqrt{6} - 4, \) so \( f(\sqrt{6}) = 2 - \sqrt{2} \times \sqrt{6} - 4, \) so \( f(\sqrt{6}) = 2 - \sqrt{2} \times \sqrt{6} - 4, \) so \( f(\sqrt{6}) = 2 - \sqrt{2} \times \sqrt{6} - 4, \) so \( f(\sqrt{6}) = 2 - 2\sqrt{3}. \)

7. The dashed graph on the left is \( y = \frac{1}{2} \sin \left( \frac{1}{2} x \right). \) On the right is \( y = 1 \sin 2x. \)

8. \( (a) \ \text{We need to evaluate } \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}. \) Now \( f(x+h) = (x+h)^2 - 3 = x^2 + 2hx + h^2 - 3. \)

So \( \lim_{h \to 0} \frac{(x^2 + 2hx + h^2 - 3) - (x^2 - 3)}{h} = \lim_{h \to 0} \frac{x^2 + 2hx + h^2 - 3 - x^2 + 3}{h} = \]

\( \lim_{h \to 0} \frac{2hx + h^2}{h} = \lim_{h \to 0} 2x + h = 2x. \)

(b) We know from (a) that \( f'(x) = 2x, \) so at the point (0, -3), \( f'(0) = 2 \times 0 = 0, \) so \( m = 0. \) We know that \( y = mx + c, \) so \( y = 0x + c. \) Substitute in the point (0, -3), \(-3 = c, \) so the equation is \( y = -3. \)

9. \( (a) \ \text{The points at which } f'(x) = 0 \text{ are the critical points of } f(x), \) so the \( x \)-coordinates are \( x = -1, x = 1 \) and \( x = 2. \)

(b) \( \text{The intervals where the slope } (f'(x)) \text{ is negative are the intervals on which } f \text{ is decreasing, so } (-2, -1) \cup (1, 2). \)

(c) \( \text{As } f \text{ is decreasing between } x = 1 \text{ and } x = 2, \text{ the critical point of } f' \text{ between } x = 1 \text{ and } x = 2 \text{ must be a local minimum.} \)
(d) The slope at \( x = 3 \) and \( x = 0 \) is positive, with the slope at \( x = 3 \) being the steeper of the two. The slope at \( x = 1 \) is approximately zero and the slope at \( x = -2 \) is negative. In increasing order: \( f'(-2), f'(1), f'(0) \) and \( f'(3) \).

10. (a) \( \frac{dy}{dx} = -8x^3 + 6. \)

(b) Using the chain rule from the notes, \( \frac{dy}{dx} = - \sin(\sqrt{x}) \times \frac{1}{2}x^{-1/2} = - \frac{\sin(\sqrt{x})}{2\sqrt{x}}. \)

(c) Firstly, we need to use the product rule on \( x\ln x. \) Let \( g = x\ln x, u = x \) and \( v = \ln x, \) so \( u' = 1 \) and \( v' = \frac{1}{x}. \) So \( g' = x\ln x + \frac{x}{x} = x\ln x + 1. \) Thus \( \frac{dy}{dx} = \ln x + 1 - 1 = \ln x. \)

11. (a) Using the chain rule from the notes, \( \frac{dy}{dx} = 12x^2 + 1)^3 \times 2x = 24x(x^2 + 1)^3. \)

(b) Using the quotient rule, let \( u = x^2 - 1 \) and \( v = x^2 + 1. \) Now \( u' = 2x \) and \( v' = 2x. \) So \( \frac{dy}{dx} = \\
\frac{u'v - v'u}{v^2} = \frac{2x(x^2 + 1) - 2x(x^2 - 1)}{(x^2 + 1)^2} = \frac{2x^3 + 2x - 2x^3 + 2x}{(x^2 + 1)^2} = \frac{4x}{(x^2 + 1)^2}. \)

13. (a) \( v(t) = \int a(t)dt = \int 6t + 2dt = 3t^2 + 2t + C. \) We know that \( v(1) = 7, \) so \( 7 = 3(1)^2 + 2 \times 1 + C, \) so \( 7 = 3 + 2 + C, \) so \( C = 2. \) Hence \( v(t) = 3t^2 + 2t + 2. \)

(b) \( S(t) = \int v(t)dt = \int 3t^2 + 2t + 2dt = t^3 + t^2 + 2t + C. \) We know that \( S(1) = 7, \) so \( 7 = (1)^3 + (1)^2 + 2 \times 1 + C, \) so \( 7 = 1 + 1 + 2 + C, \) so \( C = 3. \) We know that \( S(1) = 7. \) Now \( S(2) = (2)^3 + (2)^2 + 2 \times 2 + 2 = 8 + 4 + 4 + 3 = 19. \) Thus between \( t = 1 \) and \( t = 2, \) the rocket travelled \( S(2) - S(1) = 19 - 7 = 12. \)

(c) \( v(t) = 3t^2 + 2t + 2, \) so we need to solve \( 10 = 3t^2 + 2t + 2. \) Rearranging, we get \( 0 = 3t^2 + 2t - 8, \) which we can solve using the quadratic formula. \( t = \frac{-2 \pm \sqrt{2^2 - 4 \times 3 \times -8}}{2 \times 3} = \frac{-2 \pm \sqrt{4 + 96}}{6} = \frac{-2 \pm \sqrt{100}}{6} = \frac{-2 \pm 10}{6}, \) so \( t = \frac{-2 + 10}{6} \) or \( t = \frac{-2 - 10}{6}, \) so \( t = \frac{8}{6} \) or \( t = \frac{-12}{6}, \) so \( t = \frac{4}{3} \) or \( t = -2. \) But \( t \) can’t be negative, so \( t = \frac{4}{3}. \)

14. (a) \( 2x^2 + 3x + C. \) (b) \( \ln x - \frac{1}{2}(2e^{-2x}) + C = \ln x - e^{-2x} + C. \)

(c) \( [e^x - e^{-x}]_0 = (e^1 - e^{-1}) = (e^0 - e^0) = (e - e^{-1}) - (1 - 1) = e - \frac{1}{e}. \)

(d) \( \left[ \frac{1}{2}x^2 + \frac{1}{3}x^3 + \frac{1}{4}x^4 \right]_1 = \left( \frac{1}{2}(1)^2 + \frac{1}{3}(1)^3 + \frac{1}{4}(1)^4 \right) - \left( \frac{1}{2}(-1)^2 + \frac{1}{3}(-1)^3 + \frac{1}{4}(-1)^4 \right) = \left( \frac{1}{2} + \frac{1}{3} + \frac{1}{4} \right) - \left( \frac{1}{2} - \frac{1}{3} + \frac{1}{4} \right) = \frac{1}{2} + \frac{1}{3} + \frac{1}{4} - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} = \frac{2}{3}. \)

15. (a) \( F = 1000(1 + 0.1)^3 = 1000(1.1)^3 = 1000 \times 1.33 = $1330. \)

(b) \( F = 1000 \left( 1 + \frac{0.1}{2} \right)^{3 \times 2} = 1000(1.05)^6 = 1000 \times 1.34 = $1340. \)

(c) \( F = 1000e^{0.1 \times 0.3} = 1000 \times 1.35 = $1350. \)

(d) Because with interest compounding continuously, you are earning interest on your interest.

16. (a) Using the product rule from the notes, let \( u = x^2 - 2x + 1 \) and \( v = e^x. \) Now \( u' = 2x - 2 \) and \( v' = e^x. \) So \( \frac{dy}{dx} = u'v + v'u = (2x - 2)(e^x) + (e^x)(x^2 - 2x + 1) = e^x(2x - 2 + x^2 - 2x + 1) = (x^2 - 1)e^x. \)
(b) If \( \frac{dy}{dx} = 0 \), then \((x^2 - 1)e^x = 0\), so either \( e^x = 0 \) (which is impossible) or else \((x^2 - 1) = 0\), so \( x^2 = 1 \), so \( x = 1 \) or \( x = -1 \).

(c) Using the product rule from the notes, let \( u = x^2 - 1 \) and \( v = e^x \). Now \( u' = 2x \) and \( v' = e^x \). So \( \frac{d^2y}{dx^2} = u' \times v + u' \times u = 2xe^x + e^x(x^2 - 1) = e^x(2x + x^2 - 1) \).

(d) From the notes we know that a critical point is a local maximum if \( y''(x) < 0 \) and a local minimum if \( y''(x) > 0 \). We found \( y'' \) in Part (c). Hence \( y''(1) = e^1(2 \times 1 + 1^2 - 1) = e^1(2) \), which is positive, so at \( x = 1 \) there is a local minimum. Next, \( y''(-1) = e^{-1}(2 \times -1 + (-1)^2 - 1) = e^{-1}(-2) \), which is negative, so at \( x = -1 \) there is a local maximum. The \( y \)-coordinates are \( y(1) = (1^2 - 2 \times 1 + 1)e^1 = 0e^1 = 0 \) and \( y(-1) = ((-1)^2 - 2 \times -1 + 1)e^{-1} = 4e^{-1} = \frac{4}{e} \). So there is a local minimum at \((1,0)\) and a local maximum at \((-1, \frac{4}{e})\).

17. The equation of a circle is \((x-a)^2+(y-b)^2 = r^2\). Using centre \((0, 0)\) and radius \(\sqrt{5}\), we get \((x-0)^2+(y-0)^2 = (\sqrt{5})^2\), so \(x^2 + y^2 = 5\). To solve: \(y = x^2 + 1\) \((1)\) \(x^2 + y^2 = 5\) \((2)\)

Rearrange (2) to get \(x^2 = 5 - y^2\) and substitute into (1). Then \(y = 5 - y^2 + 1\), so \(0 = -y^2 - y + 6\), which we can solve using the quadratic formula. \(y = \frac{-(-1) \pm \sqrt{(-1)^2 - 4 \times -1 \times 6}}{2 \times -1} = \frac{1 \pm \sqrt{1 + 24}}{-2} = \frac{1 \pm \sqrt{25}}{-2} = \frac{1 \pm 5}{-2} \). So \(y = \frac{1 + 5}{-2}\) or \(\frac{1 - 5}{-2}\), so \(y = -3\) or \(y = 2\).

Firstly, substituting \(y = -3\) into (1) gives us \(-3 = x^2 + 1\), so \(x^2 = -4\), which is impossible, so \(y = -3\) is not a solution.

Secondly, substituting \(y = 2\) into (1) gives us \(2 = x^2 + 1\), so \(x^2 = 1\) so \(x = 1\) or \(x = -1\). Hence the solutions are \((x, y) = (1, 2)\) and \((x, y) = (-1, 2)\).

Now we should always check the answer. Substitute \((x, y) = (1, 2)\) and then \((x, y) = (-1, 2)\) into Equations (1) and (2), and see that both equations are satisfied, so both answers must be correct.
1. Find $R$ if $-6 = \sum_{i=0}^{2} (-2)^i \times i \times R$. (4 marks)

2. Removed (not relevant). (5 marks)

3. Let $A$, $B$ and $C$ be sets. In each of Parts (a), (b), (c) and (d), you are given an expression involving these sets, and a Venn diagram. On each Venn diagram, shade the region which corresponds to the expression. If the expression equals the empty set, state that the answer is the empty set. Note: to save space, the diagram is only shown for Part (a).

(a) $(A \cup B) \cup (A \cup C) \cup (B \cup C)$. (2 marks)

(b) $(A \setminus B) \cap (B \setminus A)$. (2 marks)

(c) $(A \setminus C) \setminus B$. (2 marks)

(d) $A \setminus (C \setminus B)$. (2 marks)

4. Simplify $\frac{2^{n+1} - 2^n + 2^{n-1}}{2^n - 2^{n-1} + 2^{n-2}}$. (3 marks)

5. Solve the following system of two simultaneous equations.

\[
\begin{align*}
6x + 4y &= 1 \\
-3x - 2y &= 5.
\end{align*}
\] (3 marks)

6. Find the straight line distance between the points $(4, 2)$ and $(1, 5)$, expressing your answer as a surd in simplest form. (2 marks)

7. I roll two fair, six-sided dice, one coloured green and the other coloured blue. Let $g$ denote the number on the green die and $b$ the number on the blue die. What is the probability that:

(a) $g = 3$ and $b = 4$? (2 marks)

(b) $g < b$? (2 marks)

(c) $g$ is odd? (2 marks)

(d) $g$ and $b$ are both prime numbers? (1 is not prime) (2 marks)

8. Find the equation of the line passing through the points $(-\sqrt{2}, 2\sqrt{6})$ and $(2\sqrt{2}, -\sqrt{6})$, expressing the gradient and $y$-intercept as surds in simplest form. (3 marks)

9. (a) Find from first principles, using limits, the slope of $f(x) = \frac{2}{x}$. (4 marks)

(b) Hence, or any other way that you like, explain why $f(x)$ has no critical points. (2 marks)

(c) Show that the gradient of $f(x)$ at the point $(-2, -1)$ is $-\frac{1}{2}$. Find the line which is tangential to the curve at the point $(-2, -1)$. (3 marks)
10. In each of Parts (a) to (f), find \( \frac{dy}{dx} \), simplifying where possible. (1 mark, 1 mark, 2 marks, 3 marks, 3 marks, 4 marks).

(a) \( y = 3x^3 - 4x^2 + 2 \)  
(b) \( y = \frac{1}{\sqrt{2}} \)  
(c) \( y = 3e^{3x} + 3e^2 \)  
(d) \( y = (3x - 1)^{10} \)  
(e) \( y = \frac{\ln x}{x} \)  
(f) \( y = \sqrt{\sqrt{x} + 4} \)

11. Shown below are two copies of the graph of \( y = \sin x \), for \( x \in [-2\pi, 2\pi] \). In each of Parts (a) and (b), sketch your graph on the set of axes. Note: to save space, the diagram is only shown for Part (a).

(a) Sketch a graph of \( y = -\sin x \) for \( x \in [-2\pi, 2\pi] \). (2 marks)

(b) Sketch a graph of \( y = \frac{1}{2} \sin 2x \) for \( x \in [-2\pi, 2\pi] \). (2 marks)

12. The following diagram contains the graph of a function and the graph of the derivative of the function. The graphs are labelled A and B. Clearly identify which graph represents the function, and which represents the derivative. Explain your answer. (Most marks will be assigned to your explanation.) (3 marks)

13. Here are eight equations, with their graphs drawn below the equations, in random order, with eight extra (unused) graphs included. Match each equation with its graph. (8 marks)

(1) \( y = -(-x)^2 \)  
(2) \( y = x + 2^{10} \)  
(3) \( x + y = 0 \)  
(4) removed (not relevant)  
(5) \( y = \pi^x \)  
(6) \( y = |\sqrt{2}x| \)  
(7) \( y = 4(x - 3) - 4x \)  
(8) \( x + x + x = -y - y - y - 3 \)
14. A rocket takes off vertically at time \( t = 0 \), with displacement \( S(t) = pt^2 - qt \), where \( p \) and \( q \) are constants.

(a) When \( t = 0 \), the rocket has velocity \( v(0) = 5 \). When \( t = 1 \), the rocket has velocity \( v(1) = 12 \). Find the values of \( p \) and \( q \) and an expression for the velocity of the rocket at any time \( t \). (3 marks)

(b) At what time is the velocity of the rocket exactly equal to its acceleration? (2 marks)

(c) How far does the rocket travel between \( t = 1 \) and \( t = 2 \)? (2 marks)

15. Find each of the following integrals. (1 mark, 2 marks, 2 marks, 2 marks)

(a) \( \int (x^3 + 2) \, dx \)  
(b) \( \int (\cos x + x) \, dx \)  
(c) \( \int_{-1}^{0} e^{2x} \, dx \)  
(d) \( \int_{1}^{2} (x^{-1} + 1) \, dx \)

16. (a) Consider the following isosceles, right-angled triangle, with two sides of length 1 unit.

Using Pythagoras’ formula \( h^2 = a^2 + b^2 \), determine the length of the hypotenuse. (2 marks)

(b) Hence find \( \cos(\pi/4) \) and \( \sin(\pi/4) \). (2 marks)

17. For each of Parts (a) to (d), let \( y = e^x \cos x \).

(a) Show that \( \frac{dy}{dx} = e^x(\cos x - \sin x) \). (3 marks)

(b) Using the result from Question 16(b), show that \( x = \pi/4 \) is a solution to \( \frac{dy}{dx} = 0 \). (2 marks)

(c) Find \( \frac{d^2y}{dx^2} \). (4 marks)

(d) Hence (or any other way that you like), determine whether \( x = \pi/4 \) is a maximum or minimum. (3 marks)

18. Find all roots of the following polynomial. \( z^6 - 9z^3 + 8 = 0 \) (5 marks)
16.17 Solutions to final exam, Dec 2004

1. \[-6 = \sum_{i=0}^{2} ((-2)^i \times i \times R) \text{ so } -6 = ((-2)^0 \times 0 \times R) + ((-2)^1 \times 1 \times R) + ((-2)^2 \times 2 \times R) \text{ so } -6 = (0) + (-2R) + (4 \times 2R) \]
   so \(-6 = -2R + 8R \text{ so } -6 = 6R, \text{ so } R = -1.\)

2. Removed (not relevant).

3. (a) 
   - A
   - B
   - C

   (b) 
   - A
   - B
   - C

   (c) 
   - A
   - B
   - C

   (d) 
   - A
   - B
   - C

4. Now \[\frac{2^{n+1} - 2^n + 2^{n-1}}{2^n - 2^{n-1} + 2^{n-2}} = \frac{2^{n-1} \times 2^2 - 2^{n-1} \times 2^1 + 2^{n-1}}{2^{n-2} \times 2^2 - 2^{n-2} \times 2^1 + 2^{n-2}} = \frac{2^{n-1} (2^2 - 2^1 + 1)}{2^{n-2} (2^2 - 2^1 + 1)} = \frac{2^{n-1}}{2^{n-2}} = \frac{2^{n-2} \times 2^1}{2^{n-2}} = 2.\]

5. To solve: \[6x + 4y = 1 \quad (1) \quad -3x - 2y = 5 \quad (2)\]
   Multiply (2) by 2, giving \(-6x - 4y = 10.\) Adding this to (1) gives \(6x + 4y - 6x - 4y = 1 + 10, \text{ so } 0 = 11.\) This is impossible, so there is no solution.

6. Let \((x_1, y_1) = (4, 2)\) and \((x_2, y_2) = (1, 5).\)
   Then \[d = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2} = \sqrt{(4 - 1)^2 + (2 - 5)^2} = \sqrt{3^2 + (-3)^2} = \sqrt{9 + 9} = \sqrt{18} = 3\sqrt{2}.\]

7. The table below contains all 36 possible outcomes when two dice are thrown. In each case, the first number is the value shown on the green die, and the second number is the value shown on the blue die.

<p>| | | | | | |</p>

</table>

   (a) \(g = 3\) and \(b = 4\) happens in 1 case: \(\text{Prob}(g = 3, b = 4) = \frac{1}{36}.\)

   (b) \(g < b\) in 15 cases: \(\text{Prob}(g < b) = \frac{15}{36} = \frac{5}{12}.\)

   (c) \(g\) is odd in 18 cases: \(\text{Prob}(g \text{ is odd}) = \frac{18}{36} = \frac{1}{2}.\)

   (d) \(g\) and \(b\) are both prime numbers in 9 cases: \(\text{Prob}(g \text{ and } b \text{ both prime}) = \frac{9}{36} = \frac{1}{4}.\)

8. Let \((x_1, y_1) = (-\sqrt{2}, 2\sqrt{6})\) and \((x_2, y_2) = (2\sqrt{2}, -\sqrt{6}).\) From the notes \(m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{-\sqrt{6} - 2\sqrt{6}}{2\sqrt{2} - (-\sqrt{2})} = \frac{-3\sqrt{6}}{3\sqrt{2}} = \frac{-\sqrt{6}}{\sqrt{2}} = \frac{-\sqrt{3}\sqrt{2}}{\sqrt{2}} = -\sqrt{3}.\) So the equation is \(y = -\sqrt{3}x + c.\)

   Substitute in the point \((-\sqrt{2}, 2\sqrt{6}),\) so \(2\sqrt{6} = -\sqrt{3} \times -\sqrt{2} + c, \text{ so } 2\sqrt{6} = \sqrt{6} + c, \text{ so } c = \sqrt{6}.\) The equation is \(y = -\sqrt{3}x + \sqrt{6}.\)
9. (a) We must find \( \lim_{h \to 0} \frac{f(x+h) - f(x)}{h} \). Now \( f(x+h) = \frac{2}{x+h} \).

So \( \lim_{h \to 0} \frac{2}{x+h} - \frac{2}{x} = \lim_{h \to 0} \frac{2}{x+h} - \frac{2}{x} \cdot \frac{1}{h} = \lim_{h \to 0} \frac{2 - \frac{2}{x}h}{x+h} = \frac{2}{x} \).

\[\lim_{h \to 0} \frac{2x}{x(x+h)} - \frac{2(x+h)}{x(x+h)} = \lim_{h \to 0} \frac{2x - 2x - 2h}{x(x+h)} = \lim_{h \to 0} \frac{-2h}{x(x+h)} = \frac{-2}{x^2}.\]

(b) The critical points of \( f(x) \) are where \( f'(x) = 0 \). Thus a critical point is where \( x^2 = 0 \), so \( x = 0 \).

(c) From (a) we know that the tangent line has gradient \( m = \frac{-2}{x^2} \). So at the point \((-2, -1)\), \( m = \frac{-2}{(-2)^2} = \frac{-2}{4} = \frac{-1}{2} \), so the equation is \( y = \frac{-1}{2}x + c \). Substitute in \((-2, -1)\), giving \(-1 = \frac{-1}{2} \cdot -2 + c\), so \( c = -2 \). Thus the equation is \( y = \frac{-1}{2}x - 2 \).

10. (a) \( \frac{dy}{dx} = 9x^2 - 8x \). (b) \( \frac{dy}{dx} = 0 \). (c) \( \frac{dy}{dx} = 9e^{3x} \).

(d) Using the chain rule, \( \frac{dy}{dx} = 10(3x-1)^9 \times 3 = 30(3x-1)^9 \).

(e) Using the quotient rule, let \( u = \ln x \) and \( v = x \). Now \( u' = \frac{1}{x} \) and \( v' = 1 \).

So \( \frac{dy}{dx} = \frac{u' \cdot v - u \cdot v'}{v^2} = \frac{1 \times x - 1 \times \ln x}{x^2} = \frac{1 - \ln x}{x^2} \).

(f) \( y = \sqrt{\sqrt{x + 4}} = (\sqrt{x + 4})^{1/2} = (x^{1/2} + 4)^{1/2} \).

Now using the chain rule, \( \frac{dy}{dx} = \frac{1}{2}(x^{1/2} + 4)^{-1/2} \times \frac{1}{2}x^{-1/2} = \frac{1}{4}x^{-1/2}(x^{1/2} + 4)^{-1/2} = \frac{1}{4\sqrt{x}(\sqrt{x + 4})} \).

11. The dashed graph on the left is \( y = -\sin x \). On the right is \( y = \frac{1}{2}\sin 2x \).

12. The function is Graph B. The derivative is Graph A.

**Explanation**: Suppose that Graph A is the function (and Graph B its derivative). The increasing sections of Graph A (between \( y = 0 \) and the local maxima) should have a positive derivative (gradient) but the corresponding section of Graph B is actually negative. This means that Graph B is definitely not the derivative of Graph A. Hence Graph B must be the function.

14. (a) \( v(t) = \frac{dS}{dt} = 2pt - q \). We know that \( v(0) = 5 \), so \( 5 = 2 \times p \times 0 - q \), so \( q = -5 \), so \( v(t) = 2pt + 5 \).

We also know that \( v(1) = 12 \), so \( 12 = 2 \times p \times 1 + 5 \), so \( 12 = 2p + 5 \), so \( 7 = 2p \), so \( p = \frac{7}{2} \). Hence \( v(t) = 2 \times \frac{7}{2}t + 5 = 7t + 5 \).

(b) We know that \( a(t) = \frac{dv}{dt} = 7 \). So for velocity to equal acceleration, we need \( v(t) = a(t) \), so \( 7t = 7 \), so \( t = \frac{2}{7} \).

(c) \( S(t) = \frac{7}{2}t^2 + 5t \), so \( S(1) = \frac{7}{2} \times 1^2 + 5 \times 1 = \frac{7}{2} + 5 = 8.5 \). Now \( S(2) = \frac{7}{2} \times 2^2 + 5 \times 2 = 14 + 10 = 24 \).

Thus between \( t = 1 \) and \( t = 2 \), the rocket travelled \( S(2) - S(1) = 24 - 8.5 = 15.5 \).

15. (a) \( \frac{x^4}{4} + 2x + C \). (b) \( \sin x + \frac{x^2}{2} + C \).

(c) \( \frac{1}{2}e^{2x} x - 1 = \left( \frac{1}{2}e^{2x} x \right) - \left( \frac{1}{2}e^{2x} x \right) = \frac{1}{2}e^0 - \frac{1}{2}e^{-2} = \frac{1}{2} - \frac{1}{2}e^{-2} = \frac{1}{2}(1 - e^{-2}) = \frac{1}{2}(1 - e^{-2}). \)

(d) \( \int_1^2 (x^{-1} + 1)dx = \int_1^2 \frac{1}{x} + 1 dx = [\ln x + x]^2_1 = (\ln 2 + 2) - (\ln 1 + 1) = \ln 2 + 2 - \ln 1 - 1 = \ln 2 + 0 - 1 = \ln 2 + 1. \)

16. (a) \( h^2 = a^2 + b^2 \), so \( h^2 = 1^2 + 1^2 \), so \( h^2 = 2 \), so \( h = \pm \sqrt{2} \). But you can’t get a negative length, so \( h = \sqrt{2} \).

(b) Now we have the triangle below (same as in the notes).

\[
\begin{array}{c}
1 \\
\sqrt{2} \\
\pi/4 \\
\\hline
1/4
\end{array}
\]

Now from the notes we know that \( \cos \theta = \frac{\text{adjacent}}{\text{hypotenuse}} \) and \( \sin \theta = \frac{\text{opposite}}{\text{hypotenuse}} \). So looking at the above triangle, we get \( \cos \frac{\pi}{4} = \frac{1}{\sqrt{2}} \) and \( \sin \frac{\pi}{4} = \frac{1}{\sqrt{2}} \).

17. (a) Using the product rule from the notes, let \( u = e^x \) and \( v = \cos x \). Now \( u' = e^x \) and \( v' = -\sin x \).

So \( \frac{dy}{dx} = u'v + v'u = e^x(\cos x) + (-\sin x)e^x = e^x(\cos x - \sin x) \).

(b) If \( \frac{dy}{dx} = 0 \), then \( e^x(\cos x - \sin x) = 0 \), so either \( e^x = 0 \) (which is impossible) or else \( \cos x - \sin x = 0 \).

Now from Q16(b) we know that \( \cos \frac{\pi}{4} = \frac{\pi}{4} \), so \( \cos \frac{\pi}{4} - \sin \frac{\pi}{4} = 0 \). Hence \( x = \frac{\pi}{4} \) is a solution.

(c) Using the product rule from the notes, let \( u = e^x \) and \( v = \cos x - \sin x \). Now \( u' = e^x \) and \( v' = -\sin x - \cos x \).

So \( \frac{d^2y}{dx^2} = u'v + v'u = e^x(\cos x - \sin x) + (-\sin x - \cos x)e^x = e^x(\cos x - \sin x) - e^x \sin x - e^x \cos x = -2e^x \sin x \).

(d) From the notes we know that a critical point is a maximum if \( y''(x) < 0 \) and a local minimum if \( y''(x) > 0 \). We found \( y'' \) in part (c). So \( y''(\frac{\pi}{4}) = -2e^{\pi/4} \sin \frac{\pi}{4} = -2e^{\pi/4} \times \frac{1}{\sqrt{2}} = -\sqrt{2}e^{\pi/4} \) which is negative. Hence \( x = \frac{\pi}{4} \) is a local maximum.

18. Let \( x = z^3 \), so now the equation reads \( x^2 - 9x + 8 = 0 \). We can use the quadratic formula from the notes to solve. So \( x = \frac{9 \pm \sqrt{(-9)^2 - 4 \times 1 \times 8}}{2 \times 1} = \frac{9 \pm \sqrt{81 - 32}}{2} = \frac{9 \pm \sqrt{49}}{2} = \frac{9 \pm 7}{2} \), so \( x = \frac{9 + 7}{2} = 5 \) or \( x = \frac{9 - 7}{2} = 1 \).

Recalling \( x = z^3 \), we must have \( z^3 = 8 \) or \( z^3 = 1 \), so \( z = 2 \) or \( z = 1 \). Hence the roots of the polynomial are \( z = 1 \) and \( z = 2 \).
1. Find \( R \) if \(-6 = \sum_{i=1}^{3} ((-1)^i \times i \times R^{i-1})\). (4 marks)

2. Removed (not relevant). (5 marks)

3. Let \( A, B \) and \( C \) be sets. In each of Parts (a), (b), (c) and (d), you are given an expression involving these sets, and a Venn diagram. On each Venn diagram, shade the region which corresponds to the expression. If the expression equals the empty set, state that the answer is the empty set. Note: to save space, the diagram is only shown for Part (a).

(a) \((A \cap B) \cup (A \cap C)\). (2 marks)

(b) \((A \setminus B) \cap (C \setminus B)\). (2 marks)

(c) \((A \setminus B) \cup ((B \cap C) \setminus A)\). (2 marks)

(d) \(((\emptyset \setminus B) \cup (B \setminus \emptyset)) \cap (B \cup (B \setminus B))\). (2 marks)

4. Let \( f(x) = 2^x \). Simplify \( \frac{f(n+2) - f(n)}{f(n-1)} \). (3 marks)

5. Solve the following system of two simultaneous equations.
\[
\begin{align*}
6x + 4y &= 1 \\
-3x - 8y &= 4
\end{align*}
\] (3 marks)

6. Find the straight line distance between the points \((3\sqrt{3}, -2)\) and \((\sqrt{3}, 2)\), expressing your answer as a surd in simplest form. (2 marks)

7. I roll two fair, six-sided dice, one coloured green and the other coloured blue. If the two numbers shown on the dice are not relatively prime then I continue to roll again, until they are relatively prime. (Recall that two numbers are relatively prime if their Highest Common Factor is 1.) Let \( x \) denote the number shown on the green die, and \( y \) denote the number shown on the blue die (so we know that \( x \) and \( y \) are relatively prime).

(a) Using a table of all possible outcomes (or any other way you like), show that the sample space has 23 possible outcomes. (2 marks)

(b) What is the probability that \( x = y \)? (2 marks)

(c) What is the probability that \( 6 \in \{x, y\} \)? (2 marks)

(d) What is the probability that \( x \) is even? (2 marks)

8. Find the equation of the line passing through the points \((-2, -5)\) and \((-4, -1)\). (3 marks)

9. In Parts (a), (b) and (c) of this question, use the function \( f(x) = ax^2 + bx + c \), where \( a, b \) and \( c \) are constants.
(a) Find from first principles, using limits, the slope of \( f(x) \). (4 marks)

(b) Hence, or any other way that you like, show that \( f(x) = ax^2 + bx + c \) has a critical point at \( x = \frac{-b}{2a} \). (There is no need to classify the critical point as a local maximum or local minimum.) (2 marks)

(c) Suppose that the point \((1, 2a + b)\) lies on the curve \( y = ax^2 + bx + c \). Find the line which is tangential to the curve at the point \((1, 2a + b)\). (3 marks)

10. In each of Parts (a) to (g), find \( \frac{dy}{dx} \), simplifying where possible. (1 mark, 1 mark, 2 marks, 3 marks, 3 marks, 3 marks)

\[
\begin{align*}
(a) \quad & y = 3x^2 - 2x - 4 \\
(b) \quad & y = \frac{-3}{x} \\
(c) \quad & y = 3e^{3x} + 3e^2 \\
(d) \quad & y = \sin(4x) \\
(e) \quad & y = (4x + 2)^5 \\
(f) \quad & y = \frac{\ln x}{x} \\
(g) \quad & y = \sqrt{x^2 + 4}
\end{align*}
\]

11. Shown below are two copies of the graph of \( y = \sin x \), for \( x \in [-2\pi, 2\pi] \). In each of Parts (a) and (b), sketch your graph on the set of axes. Note: to save space, the diagram is only shown for Part (a).

(a) Sketch a graph of \( y = -2 \sin x \) for \( x \in [-2\pi, 2\pi] \). (2 marks)

(b) Sketch a graph of \( y = \frac{1}{2} \sin 2x \) for \( x \in [-2\pi, 2\pi] \). (2 marks)

12. The following diagram shows the graph of the derivative \( f' \) of a certain function \( f \) on the interval \( x \in [-4.1, 1.2] \). Parts (a) to (d) contain questions about the function \( f \) on this interval.

(a) What are the \( x \)-coordinate(s) of all critical points of \( f \)? (1.5 marks)

(b) Write down the interval(s) on which \( f \) is increasing. (1.5 marks)

(c) What are the \( x \)-coordinate(s) at which \( f \) has a local maximum? (1.5 marks)

(d) What are the \( x \)-coordinate(s) at which \( f \) attains its steepest positive slope? (1.5 marks)
13. Here are eight equations, with their graphs drawn below the equations, in random order, with eight extra (unused) graphs included. Match each equation with its graph. (8 marks)

- (1) \[ y = -x^2 \]
- (2) \[ y = 147x + 682 \]
- (3) \[ x + y = 0 \]
- (4) \[ x = -| -4 | \]
- (5) \[ y = 2 - x \]
- (6) \[ y = | -2x | \]
- (7) \[ y + 4x = 4(x + 1) \]
- (8) \[ (-2)^9(x + 1) = (-3)^{10}y \]

14. A rocket takes off vertically at time \( t = 0 \), with velocity \( v(t) = pt + 4 \), where \( p \) is a constant.

   (a) When \( t = 0 \), the rocket has displacement \( S(0) = 2 \). When \( t = 1 \), the rocket has displacement \( S(1) = 10 \). Find the value of \( p \) and an expression for the displacement of the rocket at any time \( t \). (3 marks)

   (b) At what time is the velocity of the rocket exactly equal to its acceleration? (2 marks)

   (c) How far does the rocket travel between \( t = 1 \) and \( t = 2 \)? (2 marks)

15. Find each of the following integrals. (1 mark, 2 marks, 2 marks, 2 marks, 2 marks)

   (a) \[ \int (-6x^2 + 2x) \, dx \]
   (b) \[ \int \left( -\frac{1}{x} + e^{2x} \right) \, dx \]
   (c) \[ \int (2\sin x + 4) \, dx \]
   (d) \[ \int_0^1 e^{-x} \, dx \]
   (e) \[ \int_1^2 (x^{-2} + 1) \, dx \]

16. For each of Parts (a) to (d), let \( y = x^2e^{-2x} \).

   (a) Show \( \frac{dy}{dx} = e^{-2x}(2x - 2x^2) \). (3 marks)

   (b) Find all values of \( x \) for which \( \frac{dy}{dx} = 0 \). (2 marks)

   (c) Recall that \( \frac{dy}{dx} = e^{-2x}(2x - 2x^2) \). Using the product rule, find \( \frac{d^2y}{dx^2} \). (3 marks)

   (d) Hence (or any other way that you like), classify all critical points of \( y \). (3 marks)

17. Solve the following system of two simultaneous equations.

\[
\begin{align*}
y &= 3x^2 + 2x - 3 \\
y &= 2x^2 - 2x + 9.
\end{align*}
\]

(5 marks)
16.19 Solutions to final exam, June 2004

1. \(-6 = \sum_{i=1}^{3}((-1)^i \times i \times R^{i-1})\) so \(-6 = ((-1)^1 \times 1 \times R^{1-1}) + ((-1)^2 \times 2 \times R^{2-1}) + ((-1)^3 \times 3 \times R^{3-1})\) so 
\[-6 = (-R^0) + (2R^1) + (-3R^2),\] so \(-6 = -1 + 2R - 3R^2\) so \(0 = -3R^2 + 2R + 5.\)

Using the quadratic formula from the notes, 
\[R = \frac{-2 \pm \sqrt{2^2 - 4 \times -3 \times 5}}{2 \times -3} = \frac{-2 \pm \sqrt{4 + 60}}{-6} = \frac{-2 \pm \sqrt{64}}{-6} = \frac{-2 \pm 8}{-6},\] so \(R = \frac{-2 + 8}{-6}\) or \(R = \frac{-2 - 8}{-6},\) so \(R = \frac{6}{-6}\) or \(R = \frac{-10}{-6},\) so \(R = -1\) or \(R = \frac{5}{3}.\)

2. Removed (not relevant).

3. (a) 
\[
\begin{array}{ccc}
A & B & C \\
A & B & C \\
A & B & C \\
\end{array}
\]
(b) 
\[
\begin{array}{ccc}
A & B & C \\
A & B & C \\
A & B & C \\
\end{array}
\]
(c) 
\[
\begin{array}{ccc}
A & B & C \\
A & B & C \\
A & B & C \\
\end{array}
\]
(d) 
\[
\begin{array}{ccc}
A & B & C \\
A & B & C \\
A & B & C \\
\end{array}
\]

4. Now \(f(n + 2) = 2^{n+2}\) and \(f(n - 1) = 2^{n-1} + 2.\) Hence \(\frac{f(n + 2) - f(n)}{f(n - 1)} = \frac{2^{n+2} - 2^n}{2^{n-1}} = \frac{2^n \times 2^2 - 2^n}{2^n \times 2^{-1}} = \frac{2^n \times (2^2 - 1)}{2^n \times 2^{-1}} = \frac{(2^2 - 1)}{2^{-1}} = \frac{4 - 1}{2^{-1}} = \frac{3}{2^{-1}} = 3 \times 2^1 = 6.\)

5. To solve: \(6x + 4y = 1\) \(\quad (1)\) \(-3x - 8y = 4\) \(\quad (2)\)

Multiplying (1) by 2 gives \(12x + 8y = 2.\) Adding this to (2) gives \(12x + 8y - 3x - 8y = 4 + 2,\) so \(9x = 6,\) so \(x = \frac{2}{3}.\)

Substitute \(x = \frac{2}{3}\) into (1) gives \(6 \times \frac{2}{3} + 4y = 1,\) so \(4 + 4y = 1\) so \(4y = -3,\) so \(y = -\frac{3}{4}.\)

Hence the solution is \((x, y) = (\frac{2}{3}, -\frac{3}{4}).\)

Now we should always check the answer. Substitute \((x, y) = (\frac{2}{3}, -\frac{3}{4})\) into Equations (1) and (2), and see that both equations are satisfied, so the answer must be correct.

6. Let \((x_1, y_1) = (3\sqrt{3}, -2)\) and \((x_2, y_2) = (\sqrt{3}, 2).\) Then \(d = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2} = \sqrt{(3\sqrt{3} - \sqrt{3})^2 + (-2 - 2)^2} = \sqrt{(2\sqrt{3})^2 + (-4)^2} = \sqrt{12 + 16} = \sqrt{28} = 2\sqrt{7}.\)

7. (a) The table below contains all of the possible outcomes when two dice are thrown, if the values must be relatively prime.

<p>| | | | | | | |</p>

(b) \(x = y\) happens in 1 case: \(\text{Prob}(x = y) = \frac{1}{23}.\)

(c) \(6 \in \{x, y\}\) happens in 4 cases: \(\text{Prob}(6 \in \{x, y\}) = \frac{4}{23}.\)

(d) \(x\) is even in 8 cases: \(\text{Prob}(x\ is\ even) = \frac{8}{23}.\)
8. Let \((x_1, y_1) = (-2, -5)\) and \((x_2, y_2) = (-4, -1)\). From the notes \(m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{-1 - (-5)}{-4 - (-2)} = \frac{-1 + 5}{-4 + 2} = \frac{4}{-2} = -2\). So the equation is \(y = -2x + c\). Substitute in the point \((-2, -5)\), so \(-5 = -2 \times -2 + c\), so \(-5 = 4 + c\), so \(c = -9\). The equation is \(y = -2x - 9\).

9. (a) We need to evaluate \(\lim_{h\to0} \frac{f(x + h) - f(x)}{h}\). Now \(f(x + h) = a(x + h)^2 + b(x + h) + c = a(x^2 + 2xh + h^2) + bx + bh + c = ax^2 + 2axh + ah^2 + bx + bh + c\).

So \(\lim_{h\to0} \frac{ax^2 + 2axh + ah^2 + bx + bh + c - (ax^2 + bx + c)}{h} = \lim_{h\to0} \frac{2axh + ah^2 + bh}{h} = \lim_{h\to0} 2ax + ah + b = 2ax + a \times 0 + b = 2ax + b\)

(b) The critical points of \(f(x)\) are where \(f'(x) = 0\). Thus a critical point is where \(2ax + b = 0\), so \(2ax = -b\), so \(x = -\frac{b}{2a}\).

(c) From (a) we know that the curve \(y = ax^2 + bx + c\) has slope \(2ax + b\) at any point. So at the point \((1, 2a + b), m = 2a \times 1 + b = 2a + b\), so the equation of the tangent line is \(y = (2a + b)x + c\). Substitute in the point \((1, 2a + b)\), giving \(2a + b = (2a + b) \times 1 + c\), so \(c = 0\). Thus the equation is \(y = (2a + b)x\).

10. (a) \(\frac{dy}{dx} = 6x - 2\). \(\text{ (b) } y = -\frac{3}{x} = -3x^{-1}. \text{ Now } \frac{dy}{dx} = 3x^{-2} = \frac{3}{x^2} \). \(\text{ (c) } \frac{dy}{dx} = 9e^{3x} \).

(d) Using the chain rule from the notes, \(\frac{dy}{dx} = \cos(4x) \times 4 = 4 \cos(4x)\). 

(e) Using the chain rule, \(\frac{dy}{dx} = 5(4x + 2)^4 \times 4 = 20(4x + 2)^4\). 

(f) Using the quotient rule, let \(u = \ln x\) and \(v = x\). Now \(u' = \frac{1}{x}\) and \(v' = 1\).

So \(\frac{dy}{dx} = \frac{v \times u' - u \times v'}{v^2} = \frac{1}{x} \times x - 1 \times \ln x}{x^2} = \frac{1 - \ln x}{x^2}\).

(g) \(y = \sqrt{(x^2 + 4)} = (x^2 + 4)^{1/2}. \text{ Now using the chain rule, } \frac{dy}{dx} = \frac{1}{2}(x^2 + 4)^{-1/2} \times 2x = x(x^2 + 4)^{-1/2} = \frac{x}{(x^2 + 4)^{1/2}} = \frac{x}{\sqrt{x^2 + 4}}\).

11. The dashed graph on the left is \(y = -2\sin x\). On the right is \(y = \frac{1}{2}\sin 2x\).

12. (a) The critical points of \(f(x)\) are where \(f'(x) = 0\), so the x-coordinates are \(x = -4, x = -1.5\) and \(x = 1\).

(b) The intervals on which \(f\) is increasing is where the slope \((f'(x))\) is positive, so \((-4, -1.5) \cup (1, 1.2]\).

(c) A local maximum has positive slope before it and negative slope after it, so there is a local maximum at \(x = -1.5\).

(d) The steepest positive slope (greatest \(f'(x)\) value) is at \(x = -3\).

14. (a) \( S(t) = \int v(t)\,dt = \int pt + 4\,dt = \frac{1}{2}pt^2 + 4t + C. \) We know that \( S(0) = 2, \) so \( 2 = \frac{1}{2}p \times 0^2 + 4 \times 0 + C, \) so \( C = 2, \) so \( S(t) = \frac{1}{2}pt^2 + 4t + 2. \) We also know that \( S(1) = 10, \) so \( 10 = \frac{1}{2}p \times 1^2 + 4 \times 1 + 2, \) so \( 10 = \frac{1}{2}p + 4 + 2, \) so \( 4 = \frac{1}{2}p, \) so \( p = 8. \) Hence \( S(t) = \frac{1}{2} \times 8t^2 + 4t + 2 = 4t^2 + 4t + 2. \)

(b) \( v(t) = 8t + 4. \) We know that \( a(t) = \frac{dv}{dt} = 8. \) So for velocity to equal acceleration, we need \( v(t) = a(t), \) so \( 8t + 4 = 8, \) so \( 8t = 4, \) so \( t = \frac{1}{2}. \)

(c) We know that \( S(1) = 10. \) Now \( S(2) = 4 \times 2^2 + 4 \times 2 + 2 = 16 + 8 + 2 = 26. \) Thus between \( t = 1 \) and \( t = 2, \) the rocket travelled \( S(2) - S(1) = 26 - 10 = 16. \)

15. (a) \( = -2x^3 + x^2 + C. \) (b) \( = -\ln x + \frac{1}{2}e^{2x} + C. \) (c) \( = -2\cos x + 4x + C. \)

(d) \( = [e^{-x}]^1 = (e^{-1}) - (e^0) = e^{-1} + 1 = -\frac{1}{e} + 1. \)

(e) \( = [x^{-1} + x]^2 = [\frac{1}{x} + x]^2 = (\frac{1}{2} + 2) - (\frac{1}{2} + 1) = \frac{1}{2} + 2 - (1 + 1) = \frac{1}{2} + 2 = \frac{3}{2}. \)

16. (a) Using the product rule from the notes, let \( u = x^2 \) and \( v = e^{-2x}. \) Now \( u' = 2x \) and \( v' = -2e^{-2x}. \) So \( \frac{dy}{dx} = u' \times v + v' \times u = 2xe^{-2x} + (-2e^{-2x})x^2 = 2xe^{-2x} - 2x^2e^{-2x} = e^{-2x}(2x - 2x^2). \)

(b) If \( \frac{dy}{dx} = 0, \) then \( e^{-2x}(2x - 2x^2) = 0, \) so either \( e^{-2x} = 0 \) (which is impossible) or else \( 2x - 2x^2 = 0, \) so \( 2x(1 - x) = 0, \) so \( x = 0 \) or \( x = 1. \)

(c) Using the product rule from the notes, let \( u = e^{-2x} \) and \( v = 2x - 2x^2. \) Now \( u' = -2e^{-2x} \) and \( v' = 2 - 4x. \) So \( \frac{d^2y}{dx^2} = u' \times v + v' \times u = -2e^{-2x}(2x - 2x^2) + (2 - 4x)e^{-2x} = -4xe^{-2x} + 4xe^{-2x} + 2e^{-2x} - 4xe^{-2x} = 4xe^{-2x} - 8xe^{-2x} + 2e^{-2x} = e^{-2x}(4x^2 - 8x + 2). \)

(d) From the notes we know that a critical point is a local maximum if \( y''(x) < 0 \) and a local minimum if \( y''(x) > 0. \) We found \( y'' \) in Part (c). Hence \( y''(0) = e^0(4 \times 0^2 - 8 \times 0 + 2) = 2 = 2, \) which is positive, so at \( x = 0 \) there is a local minimum. Next, \( y''(1) = e^{-2 \times 1}(4 \times 1^2 - 8 \times 1 + 2) = e^{-2}(4 - 8 + 2) = -2e^{-2} = -2, \) which is negative, so at \( x = 1 \) there is a local maximum. The y-coordinates are \( y(0) = 0^2e^0 = 0 \) and \( y(1) = 1^2e^{-2 \times 1} = e^{-2} = \frac{1}{e^2}. \) So there is a local minimum at \((0, 0)\) and a local maximum at \((1, \frac{1}{e^2})\).

17. To solve: \( y = 3x^2 + 2x - 3 \) \hspace{1cm} (1) \hspace{1cm} \( y = 2x^2 - 2x + 9 \) \hspace{1cm} (2)

Let (1) = (2) because \( y = y, \) so \( 3x^2 + 2x - 3 = 2x^2 - 2x + 9, \) so \( x^2 + 4x - 12 = 0. \)

Using the quadratic formula, \( x = \frac{-4 \pm \sqrt{4^2 - 4 \times 1 \times -12}}{2 \times 1} = \frac{-4 \pm \sqrt{16 + 48}}{2} = \frac{-4 \pm \sqrt{64}}{2} = \frac{-4 \pm 8}{2}, \)
so \( x = \frac{-4 + 8}{2} \) or \( \frac{-4 - 8}{2}, \) so \( x = 2 \) or \( x = -6, \) so there are two solutions.

Firstly, substituting \( x = 2 \) into (1) gives us \( y = 3 \times 2^2 + 2 \times 2 - 3, \) so \( y = 12 + 4 - 3 \) so \( y = 13. \) Hence one solution is \((x, y) = (2, 13)\).

Secondly, substituting \( x = -6 \) into (1) gives us \( y = 3 \times (-6)^2 + 2 \times -6 - 3, \) so \( y = 108 - 12 - 3 \) so \( y = 93. \) Hence another solution is \((x, y) = (-6, 93)\).

Now we should always check the answer. Substitute \((x, y) = (2, 13)\) and then \((x, y) = (-6, 93)\) into Equations (1) and (2), and see that both equations are satisfied, so both answers must be correct.
1. Find \( R \) if
\[
1 = \sum_{i=1}^{3} \frac{(i + 1)R}{2i}.
\]
(4 marks)

2. Removed (not relevant). (5 marks)

3. Let \( A, B \) and \( C \) be sets. In each of Parts (a), (b), (c) and (d), you are given an expression involving these sets. In each case, shade the region on a Venn diagram which corresponds to the expression. If the expression equals the empty set, state that the answer is the empty set (2 marks each part).

   (a) \( A \cap (B \cup C) \)  (b) \( (A \setminus B) \setminus C \)  (c) \( (A \cap B \cap C) \setminus C \)  (d) \( B \setminus (A \cap C) \)

4. Simplify \[
\frac{(x-2)^3(x^2y)}{x^3y^3} \div (x-2y^2).
\]
(3 marks)

5. Solve the following system of two simultaneous equations.
\[
3x + 2y = \sqrt{2} \quad \text{and} \quad -5x - 7y = 2\sqrt{2}.
\]
(4 marks)

6. Find the straight line distance between the points \((0, -\sqrt{7})\) and \((\sqrt{11}, 0)\), expressing your answer as a surd in simplest form. (2 marks)

7. I roll two fair, six-sided dice, one coloured green and the other blue. Let \( t \) be the total obtained by adding the scores on both dice. If \( t = 9 \), I continue to roll again until \( t \) does not equal 9. Let \( g \) denote the number shown on the green die, and \( b \) denote the number shown on the blue die (so we know that \( g + b \neq 9 \)).

   (a) Using a table of all possible outcomes (or any other way you like), show that the sample space has 32 possible outcomes. (2 marks)

   (b) What is the probability that \( t \geq 8 \)? (2 marks)

   (c) What is the probability that \( t \) is odd? (2 marks)

   (d) What is the probability that \( g = b - 1 \)? (2 marks)

8. Find the equation of the line passing through the points \((1, 4)\) and \((3, 14)\). (3 marks)

9. Find from first principles, using limits, the slope of the following function at any point \( x \):
\[
y = -x^2.
\]
(4 marks)

10. (a) Show that the slope of the curve \( y = x + 4\sqrt{x} \) at the point \((4, 12)\) is 2. (You may use any rules for differentiation that you like: there is no need to use limits.) (3 marks)

    (b) Hence, or otherwise, find the equation of the line which is tangential to the curve \( y = x + 4\sqrt{x} \) at the point \((4, 12)\). (2 marks)

11. (4 marks) If \( y = e^x \), find and simplify \( \frac{dy}{dx} \).  

    12. (4 marks) If \( y = x^4 \ln x \), find and simplify \( \frac{dy}{dx} \).

13. Let \( f(x) = \frac{x^3}{3} - 2x^2 + 3x - 1 \).

   (a) Find the coordinates of all critical points of \( f(x) \). (4 marks)

   (b) Classify each critical point as a local maximum or minimum. (3 marks)

14. The following two sets of axes each contain a graph of \( y = \sin x \), for \( x \in [-2\pi, 2\pi] \). On the first set of axes, sketch a graph of \( y = 2\sin x \). Note: to save space, the diagram is shown in the final exam paper for June 2004. (2 marks)

    Also sketch a graph of \( y = \frac{1}{2} \sin \frac{x}{2} \). (2 marks)
15. The following diagram contains the graph of a function and the graph of the derivative of the function. The graphs are labelled A and B. Clearly identify which graph represents the function, and which represents the derivative. Explain your answer. (Most marks will be assigned to your explanation.)

16. Below are eight equations, with their graphs drawn below the equations, in random order, with eight extra (unused) graphs included. Match each equation with its graph, by writing the letter of the corresponding graph next to each equation. Note that the graphs are labelled A to P.

17. A ball is thrown vertically into the air at time $t = 0$, with acceleration $a(t) = -10$.

   (i) When $t = 3$, the ball has velocity $v = 0$. Find an expression for the velocity of the ball at any time $t$.

   (ii) When $t = 1$, the ball has displacement $S = 27$. Find an expression for the displacement of the ball at any time $t$.

   (iii) At what time(s) does the ball have displacement $S = 2$?

18. Evaluate $\int_{-1}^{1} (x + x^2 + x^3 + x^4) \, dx$.

19. Find $\int \left( - \cos x + \frac{2}{x} + e^{-x} \right) \, dx$.

20. Let $y = (1 - e^x)^{10}$.

   (a) Using the chain rule (or otherwise), find $\frac{dy}{dx}$.

   (b) Find all values of $x$ for which $\frac{dy}{dx} = 0$.

21. Solve for $x$: $\sum_{i=1}^{2} \left( \sum_{j=i+1}^{3} \left( \frac{i^2}{4} + jx + i + j \right) \right) = 0$. (Hint: first expand the summation signs and then solve the resulting quadratic equation.)
16.21 Solutions to final exam, 2003

1. \[ 1 = \sum_{i=1}^{3} \frac{(i+1)R}{2i} \] so \[ 1 = \frac{(1+1)R}{2 \times 1} + \frac{(2+1)R}{2 \times 2} + \frac{(3+1)R}{2 \times 3} \] so \[ 1 = \frac{2R}{2} + \frac{3R}{4} + \frac{4R}{6} \] so \[ 1 = R + \frac{3R}{4} + \frac{2R}{3} \] so \[ 1 = \frac{12R + 9R + 8R}{12} \] so 12 = 29R. Hence \[ R = \frac{12}{29} \].

2. Removed (not relevant).

3. (a) 
   \[ \begin{array}{ccc} 
   A & B & C \\
   \hline 
   A & B & C \\
   \end{array} \]

4. \[ \frac{(x^2)^3(x^2y)}{x^3y^2} = \frac{x^6x^2y}{x^3y^2} \times x^2y^2 = \frac{x^{6+2+2}y^{1+2}}{x^3y^3} = \frac{x^2y^3}{x^2y^3} = x - x^2 = x^2 \times x^3 = x^{-2+3} = x. \]

5. To solve: \[ 3x + 2y = \sqrt{2} \] \[ (1) \]
   \[ -5x - 7y = 2\sqrt{2} \] \[ (2) \]

   From (1), \[ \frac{3}{2}x + y = \frac{\sqrt{2}}{2} \] so \[ y = -\frac{3}{2}x + \frac{\sqrt{2}}{2} \]. Substitute this into (2), giving \[ -5x - 7\left(-\frac{3}{2}x + \frac{\sqrt{2}}{2}\right) = 2\sqrt{2} \], so \[ -5x + 21 \frac{2}{2}x - \frac{7\sqrt{2}}{2} = 2\sqrt{2} \], so \[ \frac{11}{2}x = \frac{11\sqrt{2}}{2} \] and hence \[ x = \sqrt{2}. \]

   Substitute \[ x = \sqrt{2} \] into (1) gives \[ 3\sqrt{2} + 2y = \sqrt{2} \], so \[ 2y = -2\sqrt{2} \] so \[ y = -\sqrt{2}. \] Hence the solution is \[ (x, y) = (\sqrt{2}, -\sqrt{2}). \]

   Now we should always check the answer. Substitute \[ (x, y) = (\sqrt{2}, -\sqrt{2}) \] into Equations (1) and (2), and see that both equations are satisfied, so the answer must be correct.

6. Let \( (x_1, y_1) = (0, -\sqrt{7}) \) and \( (x_2, y_2) = (\sqrt{11}, 0). \)

   Then \[ d = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2} = \sqrt{(0 - \sqrt{11})^2 + (-\sqrt{7} - 0)^2} = \sqrt{(-\sqrt{11})^2 + (-\sqrt{7})^2} = \sqrt{11 + 7} = \sqrt{18} = 3\sqrt{2}. \]

7. (a) The table below contains all 32 possible outcomes when the two dice are thrown and the total doesn’t equal 9. The numbers along the top are the values shown on the blue die and the numbers along the side are the values shown on the green die. The entries in the table are the totals.

   (b) \( t \geq 8 \) happens in 11 cases: \[ \text{Prob}(t \geq 8) = \frac{11}{32}. \] (c) \( t \) is odd in 14 cases: \[ \text{Prob}(t \text{ is odd}) = \frac{14}{32} = \frac{7}{16}. \]

   (d) \( g = b - 1 \) happens in 4 cases: \[ \text{Prob}(g = b - 1) = \frac{4}{32} = \frac{1}{8}. \]

8. Let \( (x_1, y_1) = (1, 4) \) and \( (x_2, y_2) = (3, 14). \) From the notes \[ m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{14 - 4}{3 - 1} = \frac{10}{2} = 5. \] So the equation is \( y = 5x + c. \) Substitute in the point \( (1, 4) \), so \( 4 = 5 \times 1 + c, \) so \( c = -1. \) The equation is \( y = 5x - 1. \)
9. We need to find \( \lim_{h \to 0} \frac{f(x + h) - f(x)}{h} \). Now \( f(x + h) = -(x + h)^2 = -(x + h)(x + h) = -x^2 - 2h - xh. 
\[ \lim_{h \to 0} \frac{-(x^2 - h^2 - 2xh) - (-x^2)}{h} = \lim_{h \to 0} \frac{-h^2 - 2xh}{h} = \lim_{h \to 0} -h - 2x = -2x. \]

10. (a) \( y = x + 4\sqrt{x} = x + 4x^{1/2} \). Using the chain rule from the notes, \( \frac{dy}{dx} = 1 + 4 \cdot \frac{1}{2} x^{-1/2} = 1 + \frac{2}{x^{1/2}} = 1 + \frac{2}{\sqrt{x}}. \)

To find the slope at (4, 12) substitute \( x = 4 \), so \( \frac{dy}{dx} = 1 + \frac{2}{4} = 1 + 1 = 2. \)

(b) From (a) we know that \( m = 2 \) at (4, 12), so the equation is \( y = 2x + c \). Substitute in (4, 12), giving 12 = 2 \times 4 + c, so \( c = 4 \). The equation is \( y = 2x + 4 \).

11. Using the quotient rule from the notes, let \( u = e^x \) and \( v = x^2 \). Now \( u' = e^x \) and \( v' = 2x \).

So \( \frac{dy}{dx} = \frac{u'v - uv'}{v^2} = \frac{e^x \cdot x^2 - e^x \cdot 2x}{(x^2)^2} = \frac{e^x(x - 2)}{x^4} = \frac{e^x(x - 2)}{x^4} \).

12. Using the product rule from the notes, let \( u = x^4 \) and \( v = \ln x \). Now \( u' = 4x^3 \) and \( v' = \frac{1}{x} \).

So \( \frac{dy}{dx} = u'v + uv' = 4x^3 \ln x + \frac{1}{x} \times x^4 = 4x^3 \ln x + x^3 = x^3(4 \ln x + 1) \).

13. (a) Now \( f'(x) = \frac{3x^2}{3} - 4x + 3 = x^2 - 4x + 3. \) The critical points are where \( f'(x) = 0 \), so \( x^2 - 4x + 3 = 0. \) This can be solved using the quadratic formula from the notes: \( x = \frac{4 \pm \sqrt{16 - 4 \times 1 \times 3}}{2 \times 1} = \frac{4 \pm \sqrt{16 - 12}}{2} = \frac{4 \pm \sqrt{4}}{2} = \frac{4 \pm 2}{2}, \) so \( x = \frac{4 + 2}{2} = 3 \) or \( x = \frac{4 - 2}{2} = 1. \) So \( x = 3 \) or \( x = 1. \) Substitute \( x = 3 \) and \( x = 1 \) back into \( f(x) \) to find the \( y \)-coordinates: \( f(1) = \frac{1}{3} - 2(1)^2 + 3 \times 1 - 1 = \frac{1}{3} - 2 + 3 - 1 = \frac{1}{3} \) and \( f(3) = \frac{3^3}{3} - 2(3)^2 + 3 \times 3 - 1 = \frac{27}{3} - 2 \times 9 + 9 - 1 = 9 - 18 + 9 - 1 = -1. \) So the critical points are at (1, \( \frac{1}{3} \)) and (3, -1).

(b) From the notes we know that a critical point is a local maximum if \( f''(x) < 0 \) and a local minimum if \( f''(x) > 0. \) Now \( f''(x) = 2x - 4, \) so \( f''(1) = 2 \times 1 - 4 = -2, \) so at (1, \( \frac{1}{3} \)) there is a local maximum. \( f''(3) = 2 \times 3 - 4 = 2, \) so at (3, -1) there is a local minimum.

14. The dashed graph on the left is \( 2 \sin x. \) On the right is \( \frac{1}{2} \sin \frac{1}{2} x. \)

15. The function is Graph B. The derivative is Graph A.

Explanation: Suppose that Graph A is the function (and Graph B is its derivative). The increasing sections of Graph A (between the zero and the local maximums) must have a positive derivative (gradient) but the corresponding section of Graph B is actually negative. This means that Graph B is definitely not the derivative of Graph A. Hence Graph A must be the derivative of Graph B.

17. (i) \( v(t) = \int a(t) = -10t + C. \) We also know that \( v(3) = 0, \) so \( 0 = -10 \times 3 + C, \) so \( C = 30. \) Hence \( v(t) = -10t + 30. \)

(ii) \( S(t) = \int v(t) = -5t^2 + 30t + C. \) We also know that \( S(1) = 27, \) so \( 27 = -5 \times 1^2 + 30 \times 1 + C, \) so \( 27 = -5 + 30 + C, \) so \( C = 2. \) Hence \( S(t) = -5t^2 + 30t + 2. \)

(iii) To find at what time the ball has displacement \( S = 2, \) we must solve \( 2 = S(t) = -5t^2 + 30t + 2, \) so \( 0 = -5t^2 + 30t, \) so \( 0 = t(-5t + 30) . \) Thus the ball has displacement \( S = 2 \) when \( t = 0 \) and when \( (-5t + 30) = 0 \). Thus the ball has displacement \( S = 2 \) when \( t = 0 \) and \( t = 6. \)

18. \( \int_1^3 (x + x^2 + x^3 + x^4) \, dx = \left[ \frac{x^2}{2} + \frac{x^3}{3} + \frac{x^4}{4} + \frac{x^5}{5} \right]_1^3 = \left[ \frac{12}{2} + \frac{13}{3} + \frac{14}{4} + \frac{15}{5} \right] - \left[ \frac{(-1)^2}{2} + \frac{(-1)^3}{3} + \frac{(-1)^4}{4} + \frac{(-1)^5}{5} \right] = \left( \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} \right) - \left( \frac{1}{2} - \frac{1}{3} + \frac{1}{4} - \frac{1}{5} \right) = \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \frac{1}{2} - \frac{1}{3} + \frac{1}{4} - \frac{1}{5} = \frac{3}{5} + \frac{5}{15} = \frac{16}{15}. \)

19. \( \int (-\cos x + \frac{2}{x} + e^{-x}) \, dx = -\sin x + 2 \ln x - e^{-x} + C. \)

20. (a) Using the chain rule from the notes, \( \frac{dy}{dx} = 10(1 - e^x)^9 \times -e^x = -10e^x(1 - e^x)^9. \)

(b) If \( \frac{dy}{dx} = 0, \) then \(-10e^x(1 - e^x)^9 = 0, \) so either \( e^x = 0 \) (which is impossible) or else \( (1 - e^x) = 0, \) so \( 1 = e^x, \) so \( x = 0. \)

21. \( \sum_{i=1}^2 (\sum_{j=i+1}^3 (\frac{ix^2}{4} + jx + i + j)) = 0, \) so \( 3 \left(\frac{x^2}{4} + jx + 1 + j\right) + \sum_{j=3}^3 (\frac{2x^2}{4} + jx + 2 + j) = 0. \)

Then \( (\frac{x^2}{4} + 2x + 1 + 2) + (\frac{x^2}{4} + 3x + 1 + 3) + (\frac{2x^2}{4} + 3x + 2 + 3) = 0, \) so \( \frac{2x^2}{4} + 5x + 7 + \frac{2x^2}{4} + 3x + 5 = 0, \) so \( x^2 + 8x + 12 = 0. \) Using the quadratic formula from the notes, \( x = \frac{-8 \pm \sqrt{64 - 4 \times 1 \times 12}}{2 \times 1} = \frac{-8 \pm \sqrt{64 - 48}}{2} = \frac{-8 \pm \sqrt{16}}{2} = \frac{-8 \pm 4}{2}, \) so \( x = \frac{-8 + 4}{2} \) or \( x = \frac{-8 - 4}{2}, \) so \( x = -2 \) or \( x = -6. \)
1. Find $R$ if \[ \frac{2}{R} = \sum_{i=-1}^{2} \frac{1}{|2i|-1}. \] (4 marks)

2. Removed (not relevant). (5 marks)

3. Let $A = \{a, b, d, e\}$, $B = \{a, d, f, g\}$ and $C = \{a, c, e, f\}$. For parts (b), (c), (d) and (e), either write the elements of the answer set, or (if appropriate) state that the answer is the empty set. Each part is worth 2 marks.

(a) Mark the three sets $A$, $B$ and $C$ on a Venn diagram, with the elements of each set written in appropriate places on the diagram.

(b) Write the set $(A \cap C) \setminus B$.

(c) Write the set $B \setminus (B \cap B)$.

(d) Write the set $(A \cup B) \cap (C \setminus A)$.

(e) Write the set $(A \setminus \emptyset) \cap (B \setminus \emptyset) \cap (C \setminus \emptyset)$.

4. Simplify \[ \frac{2^{n+1} - 2^n}{2^n}. \] (2 marks)

5. Solve the following system of two simultaneous equations.

\[
\begin{align*}
3y - x &= 6 \\
2y + 3x &= 15.
\end{align*}
\] (4 marks)

6. Find the straight line distance between the points $(4, 2)$ and $(1, 5)$, expressing your answer as a surd in simplest form. (2 marks)

7. I roll two fair, six-sided dice, one coloured green and the other blue. Let $g$ denote the number shown on the green die, and $b$ denote the number shown on the blue die. What is the probability that:

(a) $g + b = 7$? (2 marks)

(b) $g$ is odd and $b$ is even? (2 marks)

(c) $g < b$? (2 marks)

8. Find from first principles, using limits, the slope of the following function at any point $x$:

$y = \frac{1}{x}$. (4 marks)

9. (a) Show that the slope of the curve $y = \sqrt{x}$ at the point $(4, 2)$ is $\frac{1}{4}$. (You may use any rules for differentiation that you like: there is no need to use limits.) (3 marks)

(b) Hence, or otherwise, find the equation of the line which is tangential to the curve $y = \sqrt{x}$ at the point $(4, 2)$. (2 marks)

10. (4 marks) If $y = \sin(e^{2x})$, find $\frac{dy}{dx}$. 11. (4 marks) If $y = \frac{(2x + 1)}{(2x - 1)}$, find $\frac{dy}{dx}$.

12. Let $f(x) = -x^3 + 9x^2 - 24x - 3$.

(a) Find the coordinates of all critical points of $f(x)$. (5 marks)

(b) Classify each critical point as a local maximum or minimum. (3 marks)

13. The following two sets of axes each contain a graph of $y = \sin x$, for $x \in [-2\pi, 2\pi]$. On the first set of axes, sketch a graph of $y = 2 \sin x$. Note: to save space, the diagram is shown in the final exam paper for June 2004. (2 marks)

Also sketch a graph of $y = \frac{1}{2} \sin 2x$. (2 marks)
14. The following diagram contains the graph of a function and the graph of the derivative of the function. Clearly identify which graph represents the function, and which represents the derivative. Explain your answer. (Most marks will be assigned to your explanation.)

![Graph A and Graph B]

15. Below are eight equations, with their graphs drawn below the equations. Match each equation with its graph. The graphs are labelled A to P.

(i) \( y^2 + 2y + 2 = (y + 1)^2 - x \)  
(ii) \( y = -(x - 1)(x - 3) \)  
(iii) \( 3x - 3 + 2y = 0 \)  
(iv) \( y = \sqrt{\frac{1}{16}} \)  
(v) \( y = -e^{-x} \)  
(vi) \( y = -|x| \)  
(vii) \( x = (-1)^4y \)  
(viii) \( x - \sqrt{5} = -2 \)

![Graph A to Graph P]

16. A rocket takes off vertically at time \( t = 0 \), with velocity \( v(t) = 6t \) metres/second.

(i) Find an expression for the displacement of the rocket at any time \( t \). Assume the rocket launching pad is 6 metres below ground level, so the displacement at \( t = 0 \) is \(-6\). (4 marks)

(ii) At what time \( t \) is the rocket 42 metres above ground (so it has travelled 48 metres in total). (3 marks)

17. (3 marks) Evaluate \( \int_{-1}^{1} (4x^3 + e^x + 1) \, dx \).  
18. (4 marks) Find \( \int \left( \frac{2}{x} - \sin x + e^{2x} \right) \, dx \).

19. For parts (a), (b), (c) and (d), let \( y = e^{-x} \left( -x^2 + x - 1 \right) \).

(a) Using the product rule (or otherwise), show that \( \frac{dy}{dx} = e^{-x}(x^2 - 3x + 2) \). (4 marks)

(b) Find all values of \( x \) for which \( \frac{dy}{dx} = 0 \). (3 marks)

(c) Find the second derivative of \( y \). (3 marks)

(d) Hence, or otherwise, find and classify all local maxima and minima of the function \( y \). (4 marks)
16.23 Solutions to final exam, 2001

1. \( \frac{2}{R} = \sum_{i=-1}^{2} \frac{1}{|2i-1|} \) so \( \frac{2}{R} = \left( \frac{1}{|2 \times 1 - 1|} \right) + \left( \frac{1}{|2 \times 0 - 1|} \right) + \left( \frac{1}{|2 \times 1 - 1|} \right) + \left( \frac{1}{|2 \times 2 - 1|} \right) \) so \( \frac{2}{R} = \frac{1}{|2 - 1|} + \frac{1}{|0 - 1|} + \frac{1}{|2 - 1|} + \frac{1}{|4 - 1|} \) so \( \frac{2}{R} = \frac{1}{2 - 1} + \frac{1}{0 - 1} + \frac{1}{2 - 1} + \frac{1}{4 - 1} \) so \( \frac{2}{R} = \frac{1}{1 - 1} + \frac{1}{1 + \frac{1}{3}} \) so \( \frac{2}{R} = \frac{1}{1} + \frac{1}{2} \) so \( \frac{2}{R} = \frac{3}{2} \).

2. Removed (not relevant).

3. (a) \{e\} (b) \{f\} (c) \{a\} (d) \{d\} (e) \{g\}

4. \( \frac{2^{n+1} - 2^n}{2^n} = \frac{2^n \times 2^1 - 2^n}{2^n} = \frac{2^n (2 - 1)}{2^n} = (2 - 1) = 1 \).

5. To solve:

\( 3y - x = 6 \) (1)
\( 2y + 3x = 15 \) (2)

From (1), \(-x = 6 - 3y\) so \(x = -6 + 3y\). Substitute this into (2), giving \(2y + 3(-6 + 3y) = 15\), so \(2y - 18 + 9y = 15\), so \(11y = 33\) and hence \(y = 3\).

Substitute \(y = 3\) into (1) gives us \(3 \times 3 - x = 6\), so \(9 - x = 6\) so \(-x = 6 - 9\), so \(-x = -3\) and hence \(x = 3\). Hence the solution is \((x, y) = (3, 3)\).

Now we should always check the answer. Substitute \((x, y) = (3, 3)\) into Equations (1) and (2), and see that both equations are satisfied, so the answer must be correct.

6. Let \((x_1, y_1) = (4, 2)\) and \((x_2, y_2) = (1, 5)\).

Then \(d = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2} = \sqrt{(4 - 1)^2 + (2 - 5)^2} = \sqrt{3^2 + (-3)^2} = \sqrt{9 + 9} = \sqrt{18} = 3\sqrt{2} \).

7. (a) The table below contains all 36 possible outcomes when two dice are thrown. In each case, the first number is the value shown on the green die, and the second number is the value shown on the blue die.

</table>

\(g + b = 7\) in 6 cases: \(\text{Prob}(g + b = 7) = \frac{6}{36} = \frac{1}{6}\).

(b) \(g\) is odd and \(b\) is even in 9 cases: \(\text{Prob}(g\) is odd and \(b\) is even\) = \(\frac{9}{36} = \frac{1}{4}\).

(c) \(g < b\) in 15 cases: \(\text{Prob}(g < b) = \frac{15}{36} = \frac{5}{12}\).

8. We must find \(\lim_{h \to 0} \frac{f(x + h) - f(x)}{h}\). Now \(f(x + h) = \frac{1}{x + h}\).

So \(\lim_{h \to 0} \frac{1}{x + h} - \frac{1}{x} = \lim_{h \to 0} \frac{1}{x + h} - \frac{1}{x} \times \frac{1}{h} = \lim_{h \to 0} \frac{1}{h} \times (x + h - x) = \lim_{h \to 0} \frac{1}{x + h} \times h = \lim_{h \to 0} \frac{1}{x + h} \times (x + h) = \lim_{h \to 0} \frac{x + h}{hx(x + h)} = \lim_{h \to 0} \frac{x + h}{hx(x + h)} = \lim_{h \to 0} \frac{-1}{hx(x + h)} = \lim_{h \to 0} \frac{-1}{x(x + 0)} = \frac{-1}{x^2} \).
9. (a) \( y = \sqrt{x} = x^{1/2} \). Hence \( \frac{dy}{dx} = \frac{1}{2}x^{-1/2} = \frac{1}{2\sqrt{x}} \).

So the slope at \((4, 2)\) is \( \frac{dy}{dx} = \frac{1}{2\sqrt{4}} = \frac{1}{2} \times 2 = \frac{1}{4} \).

(b) From (a) we know that \( m = \frac{1}{4} \) at \((4, 2)\), so the equation is \( y = \frac{1}{4}x + c \). Substitute in \((4, 2)\), so \( 2 = 4 \times \frac{1}{4} + c \), so \( c = 1 \). The equation is \( y = \frac{1}{4}x + 1 \).

10. Using the chain rule from the notes, \( \frac{dy}{dx} = \cos(e^{2x}) \times 2e^{2x} = 2e^{2x} \cos(e^{2x}) \).

11. Using the quotient rule from the notes, let \( u = 2x + 1 \) and \( v = 2x - 1 \). Now \( u' = 2 \) and \( v' = 2 \).

So \( \frac{dy}{dx} = \frac{u'v - uv'}{v^2} = \frac{2(2x - 1) - 2(2x + 1)}{(2x - 1)^2} = \frac{4x - 2 - 4x - 2}{(2x - 1)^2} = \frac{-4}{(2x - 1)^2} \).

12. (a) Now \( f'(x) = -3x^2 + 18x - 24 \). The critical points are where \( f'(x) = 0 \), so \(-3x^2 + 18x - 24 = 0\), so \(-3(x^2 - 6x + 8) = 0\), so \( x^2 - 6x + 8 = 0 \). This can be solved using the quadratic formula from the notes. \( x = \frac{6 \pm \sqrt{36 - 32}}{2} \times 8 = \frac{6 \pm \sqrt{4}}{2} = \frac{6 \pm 2}{2} \), so \( x = \frac{6 + 2}{2} \) or \( x = \frac{6 - 2}{2} \), so \( x = 4 \) or \( x = 2 \). Substitute \( x = 4 \) and \( x = 2 \) back into \( f(x) \) to find the \( y \)-coordinates. \( f(2) = -2^2 + 9(2)^2 - 24 \times 2 - 3 = -8 + 36 - 48 - 3 = -23 \), \( f(4) = -4^2 + 9(4)^2 - 24 \times 4 - 3 = 64 + 144 - 96 - 3 = -19 \).

So the critical points are at \((2, -23)\) and \((4, -19)\).

(b) From the notes we know that a critical point is a local maximum if \( f''(x) < 0 \) and a local minimum if \( f''(x) > 0 \). Now \( f''(x) = -6x + 18 \), so \( f''(2) = -6 \times 2 + 18 = -12 + 18 = 6 \), so at \((2, -23)\) there is a local minimum. \( f''(4) = -6 \times 4 + 18 = -6 \), so at \((4, -19)\) there is a local maximum.

13. The dashed graph on the left is \( y = 2 \sin x \). On the right is \( y = \frac{1}{2} \sin 2x \).

14. The function is Graph A. The derivative is Graph B.

   Explanation: Suppose that Graph B is the function (and Graph A its derivative). The increasing sections of Graph B (between the zero and the local maximums) should a positive derivative (gradient) but the corresponding section of Graph A is actually negative. This means that Graph A is definately not the derivative of Graph B.

16. (i) \( S(t) = \int v(t) \, dt = 3t^2 + C \). We also know that \( S(0) = -6 \), so \(-6 = 3 \times 0^2 + C \), so \( C = -6 \). Hence \( S(t) = 3t^2 - 6 \).

   (ii) To find at what time the rocket has displacement \( S = 42 \), we must solve \( 42 = S(t) = 3t^2 - 6 \), so \( 48 = 3t^2 \), so \( 16 = t^2 \). Thus the rocket has displacement \( S = 42 \) when \( t = -4 \) (impossible) and when \( t = 4 \).

17. \( \int_{-1}^{1} (4x^3 + e^x + 1) \, dx = [x^4 + e^x + x]_{-1}^{1} = [1 + e + 1] - [(-1)^4 + e^{-1} - 1] = 1 + e + 1 - (1 + \frac{1}{e^1} - 1) = 1 + e + 1 - \frac{1}{e} + 1 = 2 + e - \frac{1}{e} \).
18. \[ \int \left( \frac{2}{x} - \sin x + e^{2x} \right) \, dx = 2 \ln x + \cos x + \frac{1}{2} e^{2x} + C. \]

19. (a) Using the product rule from the notes, let \( u = e^{-x} \) and \( v = -x^2 + x - 1 \). Now \( u' = -e^{-x} \) and \( v' = -2x + 1 \).

So \( \frac{dy}{dx} = u' \times v + v' \times u = -e^{-x}(-x^2 + x - 1) + e^{-x}(-2x + 1) = e^{-x}x^2 - e^{-x}x + e^{-x} - 2xe^{-x} + e^{-x} = x^2e^{-x} - 3xe^{-x} + 2e^{-x} = e^{-x}(x^2 - 3x + 2). \)

(b) If \( \frac{dy}{dx} = 0 \), then \( e^{-x}(x^2 - 3x + 2) = 0 \), so either \( e^{-x} = 0 \) (which is impossible) or else \( x^2 - 3x + 2 = 0 \). Using the quadratic formula from the notes, \( x = \frac{3 \pm \sqrt{(-3)^2 - 4 \times 1 \times 2}}{2 \times 1} = \frac{3 \pm \sqrt{9 - 8}}{2} = \frac{3 \pm \sqrt{1}}{2} = \frac{3 \pm 1}{2} \), so \( x = \frac{3 + 1}{2} \) or \( x = \frac{3 - 1}{2} \), so \( x = 2 \) or \( x = 1 \).

(c) Note that the second derivative of \( y \) is the same as the first derivative of \( \frac{dy}{dx} \). Using the product rule from the notes, let \( u = e^{-x} \) and \( v = x^2 - 3x + 2 \). Now \( u' = -e^{-x} \) and \( v' = 2x - 3 \).

So \( \frac{d^2y}{dx^2} = u' \times v + v' \times u = -e^{-x}(x^2 - 3x + 2) + e^{-x}(2x - 3) = -x^2e^{-x} + 3xe^{-x} - 2e^{-x} + 2xe^{-x} - 3e^{-x} = -x^2e^{-x} + 5xe^{-x} - 5e^{-x} = e^{-x}(-x^2 + 5x - 5). \)

(d) From the notes we know that a critical point is a local maximum if \( \frac{d^2y}{dx^2} < 0 \) and a local minimum if \( \frac{d^2y}{dx^2} > 0 \). Now \( y''(1) = e^{-1}(-1)^2 + 5 \times 1 - 5) = e^{-1}(-1 + 5 - 5) = e^{-1} \times -1 = -e^{-1} = -\frac{1}{e}. \) The y-coordinate for \( x = 1 \) is \( y(1) = e^{-1}(-1^2 + 1 - 1) = -e^{-1} = -\frac{1}{e}. \) \( y''(2) = e^{-2}(-2^2 + 5 \times 2 - 5) = e^{-2}(-4 + 10 - 5) = e^{-2} = \frac{1}{e^2}. \) The y-coordinate for \( x = 2 \) is \( y(2) = e^{-2}(-2^2 + 2 - 1) = -3e^{-2} = -\frac{3}{e^2}. \)

Hence at \( (1, -\frac{1}{e}) \) there is a local maximum and at \( (2, -\frac{3}{e^2}) \) there is a local minimum.
