

Financial Calculus
MS479 lecture notes
Semester 1, 2000.

Mark Thompson
Department of Mathematics
The University of Queensland

Contents

1	Introduction to financial derivatives	4
1.1	European options	4
1.1.1	Option strategies	8
1.1.2	Put-call parity	10
1.2	A few exotic options	11
1.2.1	American options	11
1.2.2	Asian options	12
1.2.3	Multi-reset options	13
1.3	Financial jargon	14
1.4	Exercises	16
2	Rational pricing	19
2.1	Arbitrage	20
2.2	Inequalities involving call options	23
2.3	Inequalities involving put options	25
2.4	Exercises	26
3	Binomial asset pricing models	28
3.1	A single step model	28
3.2	A multiple step model	31
3.3	Risk-neutral pricing	37
3.4	Log-normal price dynamics	40
3.4.1	Log-normal dynamics as the limit of a binomial tree	40

3.4.2	Implication for pricing options	43
3.5	Appendix	46
3.6	Exercises	48
4	Hedging in continuous time	51
4.1	Crude hedging schemes	52
4.2	More sophisticated schemes	53
4.2.1	Delta hedging	53
4.2.2	Delta-Gamma hedging	58
4.3	Exercises	61
5	Brownian Motion	64
5.1	Frogger	66
5.2	Lévy's Construction	67
5.3	Brownian driven stock models	72
5.4	Exercises	74
6	Martingales	78
6.1	Semimartingales	82
6.2	Change of measure	83
6.3	Exercises	89
7	Stochastic calculus	90
7.1	Stochastic integration	91
7.1.1	The Riemann integral	95
7.1.2	Lebesgue integration	96
7.1.3	Itô calculus	99
7.1.4	Processes with jumps	111
7.1.5	Girsanov's Theorem	118
7.2	Solving SDEs	121
7.2.1	Solving linear SDEs	124
7.2.2	Solving SDEs by Itô's formula	128
7.2.3	Solving SDEs by Stratonovich calculus	130

CONTENTS	3
-----------------	----------

7.2.4 Solving SDEs using Girsanov's Theorem	133
7.3 Exercises	136
8 A semimartingale market model	138
8.1 Martingales and Arbitrage	139
8.2 Martingales and complete markets	143
8.3 Option pricing	147
8.4 Exercises	148
