This exam paper must not be removed from the venue

School of Mathematics & Physics

EXAMINATION – Illustration of Structure, Formula and Tables

Semester One Final Examinations, 2016

STAT2201 Analysis of Engineering and Scientific Data

This paper is for St Lucia Campus students.

Examination Duration: 120 minutes

Reading Time: 10 minutes

Exam Conditions:

This is a Central Examination

This is a Closed Book Examination - no materials permitted

During reading time - write only on the rough paper provided

This examination paper will be released to the Library

Materials Permitted In The Exam Venue:

(No electronic aids are permitted e.g. laptops, phones)

Calculators - Any calculator permitted - unrestricted

Materials To Be Supplied To Students:

none

Instructions To Students:

Additional exam materials (eg. answer booklets, rough paper) will be provided upon request.

For Examiner Use Only

Total ________

Instructions

The exams consists of 4 questions, 1-4. Each question has four items, a-d.

Within each question:

Item (a) carries a weight of 8 marks.

Item (b) carries a weight of 7 marks.

Item (c) carries a weight of 6 marks.

Item (d) carries a weight of 4 marks.

The total marks in the exam are 100.

Answer ALL questions in the spaces provided. If more space is required, use the back of the PREVIOUS page.

Show all your working and include sketches where appropriate.

Work written in the Formulae and Tables section will NOT be marked.

Formulae and Tables

Summary Statistics:

Suppose $Y_1, Y_2, \cdots, Y_n \sim N(\mu_Y, \sigma_Y^2)$ and $X_1, X_2, \cdots, X_m \sim N(\mu_X, \sigma_X^2)$ are two independent samples. The sample means and sample variances are respectively,

$$\bar{Y} = \frac{1}{n}\sum_{i=1}^{n} Y_i \qquad S_Y^2 = \frac{1}{n-1}\sum_{i=1}^{n}\left(Y_i - \bar{Y}\right)^2,$$

$$\bar{X} = \frac{1}{m}\sum_{i=1}^{m} X_i \qquad S_X^2 = \frac{1}{m-1}\sum_{i=1}^{m}\left(X_i - \bar{X}\right)^2.$$

Note that, $\sum_{i=1}^{n}(Y_i - \bar{Y})^2 = (\sum_{i=1}^{n} Y_i^2) - n\bar{Y}^2$.

The (two-sample) pooled sample variance is $S_P^2 = \frac{(n-1)S_Y^2 + (m-1)S_X^2}{n+m-2}$.

The ECDF function is: $F(t) = \frac{1}{n}\sum_{i=1}^{n} 1\{Y_i \le t\}$.

Sampling Distributions:

$$\frac{\bar{Y} - \mu_Y}{\sigma_Y / \sqrt{n}} \sim Z \qquad \frac{\bar{Y} - \mu_Y}{S_Y / \sqrt{n}} \sim t_{n-1} \qquad \frac{\left(\bar{Y} - \bar{X}\right) - \left(\mu_Y - \mu_X\right)}{S_P\sqrt{\frac{1}{n} + \frac{1}{m}}} \sim t_{n+m-2} \text{ if } \sigma_X = \sigma_Y.$$

Confidence Intervals for the Mean:

If σ_Y is known, use $\left(\bar{y} \pm z^* \sigma_Y / \sqrt{n}\right)$.

If σ_Y estimated by s_Y, use $\left(\bar{y} \pm t^* s_Y / \sqrt{n}\right)$.

Confidence Intervals for the Difference in Means for Independent Samples:

If σ_Y and σ_X are known, use $\left(\left(\bar{y} - \bar{x}\right) \pm z^* \sqrt{\frac{\sigma_Y^2}{n} + \frac{\sigma_X^2}{m}}\right)$.

If σ_Y and σ_X are unknown but assumed equal, use $\left(\left(\bar{y} - \bar{x}\right) \pm t^* s_P \sqrt{\frac{1}{n} + \frac{1}{m}}\right)$.

Hypothesis Test Basics:

Type I error: Rejection of the null hypothesis falsely (rejecting the null hypothesis when it is actually true).
Type II error: Non-rejection (retention) of the null hypothesis falsely (not-rejecting the null hypothesis when the alternative hypothesis is true).

$$\Pr(type\ I\ error) = \Pr(reject\ H_0 \mid H_0\ holds)$$
$$\Pr(type\ II\ error) = \Pr(not\ reject\ H_0 \mid H_A\ holds)$$

Significance level : $\alpha = \Pr(type\ I\ error)$
Power = $1 - \Pr(type\ II\ error)$

General Hypothesis Test Procedure:

i. Write down the null and alternative hypotheses.
ii. Select an appropriate test statistic for the test and compute it based on data.
iii. Sketch the distribution of the test statistic and mark the observed value on the plot (also the "opposite" value if the test is two-sided).
iv. Compute the tail area (or bounds for the tail area), which gives the p-value (multiply the area by 2 for a two-sided alternative hypothesis).
v. State the conclusion: If computationally possible, report the p-value; otherwise, compare the test statistic with the critical value.

Hypothesis Tests for the Mean:

To test against $H_0 : \mu = \mu_0$: If σ_Y is known, use: $\dfrac{(\bar{y} - \mu_0)}{\sigma_Y / \sqrt{n}}$ and the standard Normal distribution; otherwise, use: $\dfrac{(\bar{y} - \mu_0)}{s_Y / \sqrt{n}}$ and the t_{n-1} – distribution.

Hypothesis Tests for the Difference in Means for Independent Samples:

To test against $H_0 : \mu_Y = \mu_X$: If σ_Y and σ_X are known, use $\dfrac{\bar{y} - \bar{x}}{\sqrt{\dfrac{\sigma_Y^2}{n} + \dfrac{\sigma_X^2}{m}}}$ as a test statistic.

If σ_Y and σ_X are unknown but assumed equal, use $\dfrac{\bar{y} - \bar{x}}{s_P\sqrt{\dfrac{1}{n} + \dfrac{1}{m}}}$ as a test statistic.

Single Factorial Models (analysed through ANOVA):

For factor levels i=1,…,k, $Y_{i,j} = \mu_i + \varepsilon_{i,j}$, with $\varepsilon_{i,j} \sim N(0, \sigma^2)$.

Simple Linear Regression (estimated through least squares):

$$Y_j = \beta_0 + \beta_1 x_j + \varepsilon_j \text{, with } \varepsilon_j \sim N(0, \sigma^2).$$
