

STAT2201, Semester 1 2016

Quiz #2c (20 minutes)

Name: _____

Student ID: _____

Lecture to which you are **enrolled** (circle one): Thursday / Friday

Let M be your month of birth, i.e. $M \in \{1, 2, \dots, 12\}$. $M =$ _____.

Question 1: Assume you are faced with a random sample Y_1, Y_2, Y_3, Y_4 coming from a normal population with mean 3 and variance 8^2 . Denote the sample mean by \bar{Y} .

(a) $\Pr(|Y_1| \leq \frac{M}{3}) =$ _____

(b) $\Pr(|\bar{Y}| \leq \frac{M}{3}) =$ _____

Question 2: There are two types of bricks. Both types are normally distributed. *Regular* bricks have a mean weight of $\mu_0 = 10\text{kg}$ and a variance = 1. *Deluxe* bricks have a mean weight of $\mu_A = 11\text{kg}$ and a variance = 2. You collect a random a sample of 4 bricks known to be either all regular or all deluxe, but you are not sure which.

To make a decision, you design the following hypothesis test: You set $H_0 : \mu = \mu_0$ and $H_A : \mu = \mu_A$. As the test statistic you take the sample mean, \bar{Y} and compare it to a threshold τ . If $\bar{Y} < \tau$ you retain H_0 and otherwise you reject H_0 and accept H_A . Set now $\tau = 10 + \frac{M}{10}$.

(a) Draw a sketch of the hypothesis test, showing the distribution of \bar{Y} under H_0 and H_A and indicating the location of τ .

(b) Type I error = _____

(c) Type II error = _____

NORMAL CUMULATIVE DISTRIBUTION FUNCTION: $\Pr(Z \leq x)$
